5 Test results and Measurement Data

5.1 Antenna Requirement

Standard requirement:	47 CFR Part 15C Section §15.203
§15.203 requirement: An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator, the manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.	
EUT Antenna:	Please see Internal photos
The antenna is Antenna in Package. Therefore this EUT complies with the requirement of §15.203;	

5.2 Operation Restriction and Group Installation

Standard requirement:	47 CFR Part 15C Section §15.255(a),(b),(h)
§15.255(a),(b) requirement: Operation is not permitted for the following products: (1)Equipment used on aircraft or satellites. (2)Field disturbance sensors, including vehicle radar systems, unless the field disturbance sensors are employed for fixed operation. §15.255(h) requirement: Operation is not permitted for the following products: (1)External phase-locking.	
Conclusion: (1)Manufacturer declares that EUT will not been used on aircraft or satellites. Then user manual will include a statement to caution EUT is not permitted for used on aircraft or satellites. (2)The frequency, amplitude and phase of the transmit signal are set within the EUT. There are no external phase-locking inputs or any other means of combining two or more units together to realize a beam-forming array.	

5.3 99% Occupied Bandwidth

Test Requirement:	47 CFR FCC Part 15C §15.255(e), 47 CFR Part 2, Subpart J Section §2.1049
Test Method:	ANSI C63.10-2013 Section 9.3
Limit:	Within the designated 57GHz ~ 71GHz frequency band
Test Setup:	 $h=1.5m, d=1.0m$
Test Procedure:	a) The following procedure shall be used for measuring 99% Occupied Bandwidth: Use the following spectrum analyzer settings: 1) Span equal to approximately 1.5 times the OBW, centered on the carrier frequency. 2) RBW, prefer 1% to 5% of OBW, or a minimum of 1 MHz if this is not possible due to a large OBW. 3) VBW approximately $3 \times$ RBW. 4) Set the reference level of the instrument as required to reduce the chance of the signal amplitude exceeding the maximum spectrum analyzer input mixer level for linear operation. 5) Sweep = No faster than coupled (auto) time. 6) Detector function = peak. 7) Trace = max-hold. b) The EUT shall be transmitting at its maximum data rate. Allow the trace to stabilize. c) Use the 99% channel power function to measure the signal power. d) Repeat this test for each modulation scheme.
Test Mode:	TX mode_Make EUT continuously emit radar signals.

5.4 20dB down Emission Bandwidth

Test Requirement:	47 CFR FCC Part 15C §15.255(e), 47 CFR Part 2, Subpart J Section §2.1049
Test Method:	ANSI C63.10-2013 Section 9.3
Limit:	Within the designated 57GHz ~ 71GHz frequency band
Test Setup:	 h=1.5m,d=1.0m
Test Procedure:	The following procedure shall be used for measurement of the bandwidth for millimeter-wave devices. - Use the following spectrum analyzer settings: - Span equal to approximately 2~3 times the 20dB down Emission Bandwidth, centered on the carrier frequency. - RBW, as specified in the requirement. - VBW, as specified in the requirement, or VBW ≥ RBW if not specified. - Sweep = auto. - Detector function = peak. - Trace = max hold. - The EUT shall be transmitting at its maximum data rate. Allow the trace to stabilize. - Use the marker-to-peak function to set the marker to the peak of the emission. Use the marker-delta function to measure the specified 20dB down one side of the emission. - Reset the marker-delta function and move the marker to the other side of the emission until the delta marker amplitude is at the same level as the reference marker amplitude. The marker-delta frequency reading at this point is the specified emission bandwidth. - If this value varies with different modes of operation (data rate, modulation format, etc.), then repeat this test for each variation.
Test Mode:	TX mode_Make EUT continuously emit radar signals.

5.5 EIRP(Effective Isotropic Radiated Power) & Peak Conducted Power

Test Requirement:	47 CFR FCC Part 15C §15.255(c),(e)		
Test Method:	ANSI C63.10-2013 Section 9.5 & Section 9.7		
Limit:	EIRP Power Limit		
	Use Condition	EIRP Peak Power	EIRP Average Power
	Fixed field disturbance sensors at within the frequency band 61-61.5GHz	43dBm	40dBm
	Fixed field disturbance sensors at outside of the band 61-61.5GHz	13dBm	10dBm
	Except fixed field disturbance sensors at 61-61.5GHz	10dBm	N/A
	Except outdoor fixed Point-to-Point	43dBm	40dBm
	Outdoor fixed Point-to-Point	85dBm	82dBm
	Note:For fixed point-to-point transmitters located outdoors, the average power of any emission shall not exceed 82dBm, and shall be reduced by 2dB for every dB that the antenna gain is less than 51dBi.		
	The peak power of any emission shall not exceed 85dBm, and shall be reduced by 2dB for every dB that the antenna gain is less than 51dBi.		
	Peak Conducted Power Limit		
20dB down Emission Bandwidth	Peak Conducted Power		
> 100MHz	500mW (Equivalent 26.99dBm)		
≤100MHz	500mW*(BW/100) (Equivalent 10*Ig(5*BW)dBm)		
Note:BW=20dB down Emission Bandwidth (measured at RBW 100kHz).			
Test Setup:	 h=1.5m,d=1.0m		

Test Procedure:	(1)Maximum peak power(EIRP) – Peak detector 1. Set RBW = 1MHz; 2. Set VBW $\geq 3 \times$ RBW; 3. Span to 2~3*OBW; 4. Detector = Peak; 5. Set number of points in sweep $\geq 2 \times$ Span/RBW; 6. Sweep time=Auto couple; 7. Trace = Max hold; (2)Maximum power(EIRP) – Averaging detector Note: The maximum power(averaging detector) measurements are performed using the “channel power” measurement capability and integrated over the 99% OBW to obtain the result. 1. Measurement capability of instrument = Channel power; 2. Set RBW = 1MHz; 3. Set VBW $\geq 3 \times$ RBW; 4. Span to 2~3*OBW; 5. Channel bandwidth setting of instrument $\geq$ OBW; 6. Detector = Power averaging (RMS); 7. Set number of points in sweep $\geq 2 \times$ Span/RBW; 8. Sweep time = Auto couple; 9. Trace = Averaging;
Test Mode:	TX mode_Make EUT continuously emit radar signals.

		Vertical	-7.22	7.43	5.53	-1.305	≤26.99	Pass	Peak

Remark:

- ① This is a radiated test, and test distance of 1.0m was used for the fundamental emissions measurement.
- ② EIRP(dBm) has added free space loss of 1.0m distance.
- ③ The FMCW Chirps Correction Factor was calculated using the formula:

$$CF_{chirp} = 5 * \log \left(1 + K * \left(\frac{Span}{t * RBW^2} \right)^2 \right)$$

With t being the length of the chirp and K a correction factor for the setting process of the gaussian shaped filter (~0.1947).

Sample calculation for FMCW chirps correction factor:

$$CF_{chirp} = 5 * \log_{10} (1 + 0.1947 * (1119.0 \text{ MHz} / (1000000 \mu\text{s} * 1 \text{ MHz}^2))^2) = 0.47 \text{ dB}$$

Note: Span is the measured maximum occupied bandwidth, refer to the section of 5.4, t claimed by the customer.

- ④ Guidance for calculating the correction factor is from Application Note 1EF107-1E Rohde & Schwarz Peak and Mean Power measurements on wideband FMCW radar signals.
- ⑤ Corrected EIRP(dBm) = EIRP(dBm) + FMCW Chirps Correction Factor(dB).
- ⑥ Peak Conducted Power(dBm) = $10 * \lg(10^{(Corrected \text{ EIRP(dBm)})/10} / \text{Antenna gain(numeric)})$;
- ⑦ Antenna gain(numeric) = $10^{(Antenna \text{ gain(dBi)})/10}$;
- ⑧ Only the worst case data was recorded in the report.

This peak limit applies to the total peak emission level radiated by the device.																																													
Test Setup:	Below 30MHz: 																																													

30MHz-1GHz:

1GHz-41GHz:

Above 41GHz:

Test Procedure:	Measuring the frequency range below 1GHz, the EUT is placed on a turn table which is 0.8 meter above ground, when measuring the frequency range above 1GHz, the EUT is placed on a turn table which is 1.5 meter above ground. The turn table is rotated 360 degrees to determine the position of the maximum emission level. The EUT was positioned such that the distance from antenna to the EUT was 3 meters. The antenna is scanned between 1 meter and 4 meters to find out the maximum emission level. This is repeated for both horizontal and vertical polarization of the antenna. In order to find the maximum emission, all of the interface cables were manipulated according to ANSI C63.10: 2013 on radiated measurement. The resolution bandwidth below 30MHz setting on the field strength meter is 9kHz and 30MHz~1GHz is 120kHz and above 1GHz is 1MHz. Radiated emission measurements below 30MHz are made using Loop Antenna and 30MHz~1GHz are made using broadband Bilog antenna and above 1GHz are made using Horn Antennas. The measurement is divided into the Preliminary Measurement and the Final Measurement. The suspected frequencies are searched for in Preliminary Measurement with the measurement antenna kept pointed at the source of the emission both in azimuth and elevation, with the polarization of the antenna oriented for maximum response. The antenna is pointed at an angle towards the source of the emission, and the EUT is rotated in both height and polarization to maximize the measured emission. The emission is kept within the illumination area of the 3 dB bandwidth of the antenna. The measurement frequency range form 9kHz to 200GHz was investigated.
Test Mode:	TX mode_Make EUT continuously emit radar signals.

Radiated Spurious Emission below 30MHz:

9 kHz~30 MHz Field Strength of Unwanted Emissions. Quasi-Peak Measurement
The measurements with active loop antenna were greater than 20dB below the limit, so the test data were not recorded in the test report.

Remark:

- 1) The field strength is calculated by adding the Antenna Factor, Cable Factor & Preamplifier. The basic equation with a sample calculation is as follows:
Final Test Level =Receiver Reading + Antenna Factor + Cable Factor – Preamplifier Factor
- 2) For 40GHz to 41GHz,the limit is 90pW/cm² equivalent to an electric field strength of 85.33dBuV/m@3m.
Only the worst case data was recorded in the report.

5.7 Frequency stability

Test Requirement:	47 CFR FCC Part 15C §15.255(f)
Test Method:	ANSI C63.10-2013 Section 9.14
Limit:	Fundamental emissions must be contained within the frequency bands specified in this section during all conditions of operation.
Test Setup:	 Figure 23—Example of a frequency stability setup configuration
Test Procedure:	The carrier frequency of the transmitter is measured at room temperature. (20°C to provide a reference) At 10°C intervals of temperatures between -30°C and +50°C at the manufacturer's rated supply voltage, and At +20°C temperature and ±15% supply voltage variations. If a product is specified to operate over a range of input voltage then the -15% variation is applied to the lowermost voltage and the +15% is applied to the uppermost voltage. Measurement data showing variation in transmitter output frequency from a cold start and the elapsed time necessary for the frequency to stabilize within the applicable tolerance. Tests shall be made after temperature stabilization at each of the ambient temperature levels; the lower temperature limit, 0°C and + 30°C with no primary power applied. Beginning at each temperature level , the frequency shall be measured within one minute after application of primary power to the transmitter and at intervals of no more than one minute thereafter until ten minutes have elapsed or until sufficient measurements are obtained to indicate clearly that the frequency has stabilized within the applicable tolerance, whichever time period is greater. During each test, the ambient temperature shall not be allowed to rise more than 10°C above the respective beginning ambient temperature level.
Test Mode:	TX mode_Make EUT continuously emit radar signals.
