Subject: **RF MPE Exposure**

Re: FCC ID: 2ALGRPLX-XW8517

The MPE calculation for model PLX-XW8517 signal booster were done for frequency band 824-849MHz and band 1710-1755MHz. For each two calculations were done, these included the worst-case scenario for each of the different types of antennas that may be connected to this signal booster: outside and inside antenna. The order of the attached calculations is as follows:

850MHz band and 1700 MHz band:

1. Outside antenna: Opinion 9(Reference to antenna kitting)
2. Inside antenna: Opinion 4(Reference to antenna kitting)

A booster's uplink power must not exceed 1 Watt equivalent isotropic power for each band of operation, Composite downlink power must not exceed 0.05 watt EIRP for each band of operation. The following formula was used to calculate the equivalent isotropic radiated power:

$$\text{EIRP} = \text{Power Out (Watts)} * \text{Duty Cycle percent} * \text{Antenna Gain(non-log)} * \text{Coax loss(non-log)}$$

The power density(mW/c m²) is calculated using the following formula:

$$\text{Calculated Power density} = 1000 * \text{EIRP(Watts)} / (4 * \pi * (\text{Distance from antenna(cm)}^2))$$
