1.7 Worst-Case Configuration and Mode

Radiated Emissions and Power Line Conducted Emissions were performed with the EUT set to transmit at the channel with the highest output power as worst-case scenario.

1.8 Comments

The measurements were done with the EUT powered by 12 - 24Vdc. It was checked that power variations between 85% and 115% did not have any influence on the measurements.

The output level is set to maximum in the software.

The radiated measurements are tested on three axis.

All ports were populated during spurious emission measurements.

2 TEST REPORT SUMMARY

2.1 General

All measurements are traceable to national standards.

The tests were conducted for the purpose of demonstrating compliance with FCC CFR 47 Part 15.249 and Industry Canada RSS-210, Issue 9 and RSS-GEN, Issue 4.

Tests were performed in accordance with ANSI C63.4-2014 and ANSI C63.10-2013.

Radiated tests were performed in a semi-anechoic shielded room ($f < 1$ GHz) and a fully-anechoic shielded room ($f > 1$ GHz) at a measuring distance of 3m.

A description of the test facility is on file with the FCC and Industry Canada.

Average Detector:

RF channel	2402 MHz	2426 MHz	2480 MHz
Measured Maxium Field strength,AV (dBμV/m) –HP	85.02	82.38	80.21

Duty cycle correction of 20 dB is used

Duty Cycle Correction Factor Calculation:

According to the manufacturer:

ON time : 0.94ms and OFF time : 300ms , Duty cycle : 0.31%

Duty Cycle Correction factor = $-20 \times \log(\text{Duty Cycle}) = 20 \log(0.94/300) = -50 \text{ dB}$

Maximum allowed Duty Cycle Correction: 20 dB

Radiated measurements are performed at 3 m distance.

Antenna gain = $10 \times \log(\text{EIRP/Conducted power}) \text{ dBi}$

EIRP is calculated from measured field strength by the formulas in KDB 412172 D01 Determining ERP and EIRP v01.

The maximum field strength is obtained in XY plane and Horizontal polarization

Requirement:

(d) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in §15.209, whichever is the lesser attenuation.

(e) As shown in §15.35(b), for frequencies above 1000 MHz, the field strength limits in paragraphs (a) and (b) of §15.249 are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation. For point-to-point operation under paragraph (b) of this section, the peak field strength shall not exceed 2500 millivolts/meter at 3 meters along the antenna azimuth.
