ENGINEERING STATEMENT

The measurements shown in this report were made in accordance with the procedures described on test pages. All reported testing was carried out on a sample equipment to demonstrate limited compliance with FCC 47 CFR Part 15C, Industry Canada RSS-210 and Industry Canada RSS-GEN. The sample tested was found to comply with the requirements defined in the applied rules.

2.1.3 Date of Test

08-March-2017

2.1.4 Test Method

The test was performed in accordance with ANSI C63.10, clause 6.3 and 6.5.

The following procedure was applied as per the PAG (Tracking Number 891445):

A duty cycle correction factor was applied to the peak value of the fundamental, which was used in lieu of the Quasi-Peak detector as the emission duty cycle over a 100 ms is very short as specified in FCC 47 CFR Part 15.35. The maximum transmit period was calculated in accordance with ANSI C63.10, clause 7.5.

The duty cycle correction factor was calculated using the following formula:
 $-20\text{LOG}_{10}(5/100)$ where 5 is the maximum transmit time within any 100 ms period.

The following conversion can be applied to convert from dB μ V/m to μ V/m:
 $10^{(\text{Field Strength in dB}\mu\text{V/m}/20)}$.

Industry Canada RSS-210, Limit Clause B.10(a)

The field strength of fundamental, measured at 3 m, shall not exceed 50 mV/m.

Note: Measurements are reported in dBμV/m, the formula for conversion of the limit to dBμV/m = 20log(V /m) + 120.

e.g. 20log(0.050) + 120 = 94 dBμV/m

2.2.4 Test Method

The test was performed in accordance with ANSI C63.10, clause 6.3, 6.5 and 6.6.

To determine the average level of transmitter harmonics and spurious emissions that exhibit the same pulse timing as the transmitter above 1GHz, a duty cycle correction factor was applied to the peak value of the harmonic or spurious emission in accordance with ANSI C63.10, clause 7.5.

No duty cycle correction has been applied to emissions below 1GHz, which may exhibit the same pulse timing as the transmitter

Table 9 - 915.3 MHz - 1 GHz to 10 GHz

*No emissions were detected within 10 dB of the limit.

Figure 2 - 915.3 MHz – 1 GHz to 3 GHz

*The emission shown by the marker on the plot above is the 2nd harmonic of the fundamental frequency. Therefore in order to demonstrate compliance with the average emission limit, the peak value of 58.40 dBµV/m + 20*LOG(5/100) = 32.38 dBµV/m, where 5 ms is the maximum transmit time within a 100 ms period.

The calculated peak value of 32.38 dBµV/m, can therefore be shown to comply with both the peak and average test limits.

Devices shall comply with the following requirements:

- (a) The field strength of fundamental and harmonic emissions, measured at 3 m, shall not exceed 50 mV/m and 0.5 mV/m respectively.

The field strength limits shall be measured using an average detector, except for the fundamental emission in the frequency band 902-928 MHz, which is based on measurements using an International Special Committee on Radio Interference (CISPR) quasi-peak detector.

- (b) Emissions radiated outside of the specified frequency bands, except for harmonic emissions, shall be attenuated by at least 50 dB below the level of the fundamental emissions or to the general field strength limits listed in RSS-Gen, whichever is less stringent.
