

## RF EXPOSURE EVALUATION

According to FCC 1.1310: The criteria listed in the following table shall be used to evaluate the environment impact of human exposure to radio frequency(RF) Radiation as specified in §1.1307(b)

FCC ID: 2ANPB-RBT12200LFP

### EUT Specification

| EUT                               | Lithium Iron Phosphate Battery                                                                                                                                                                                                                   |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Limits for Maximum Permissible Exposure(MPE)

| Frequency Range(MHz)                                         | Electric Field Strength(V/m ) | Magnetic Field Strength(A/m ) | Power Density(mW/cm <sup>2</sup> ) | Average Time |
|--------------------------------------------------------------|-------------------------------|-------------------------------|------------------------------------|--------------|
| <b>(A) Limits for Occupational/Control Exposures</b>         |                               |                               |                                    |              |
| 300-1500                                                     | --                            | --                            | F/300                              | 6            |
| 1500-100000                                                  | --                            | --                            | 5                                  | 6            |
| <b>(B) Limits for General Population/Uncontrol Exposures</b> |                               |                               |                                    |              |
| 300-1500                                                     | --                            | --                            | F/1500                             | 30           |
| 1500-100000                                                  | --                            | --                            | 1                                  | 30           |

## Friis transmission formula: $P_d = (P_{out} * G) / (4 * \pi * R^2)$

Where

$P_d$  = Power density in mW/cm<sup>2</sup>

$P_{out}$  = output power to antenna in Mw

$G$  = gain of antenna in linear scale

$\pi$  = 3.1416

$R$  = distance between observation point and center of the radiator in cm

$P_d$  the limit of MPE. If we know the maximum gain of the antenna and total power input to the antenna, through the calculation, we will know the distance where the MPE limit is reached.

## Measurement Result

| Operating Mode | Channel Frequency (MHz) | Maximum output power (dBm) | Tune up tolerance (dBm) | Max. Tune up Power (dBm) | Antenna Gain (dBi) | Power density at 20cm (mW/cm <sup>2</sup> ) | Power density Limits (mW/cm <sup>2</sup> ) |
|----------------|-------------------------|----------------------------|-------------------------|--------------------------|--------------------|---------------------------------------------|--------------------------------------------|
