

BLUETOOTH TEST REPORT

Report Number: 103291273LEX-016.2
Project Number: G103291273

Report Issue Date: 5/17/2018

Product Name: External Pulse Generator

Standards: Title 47 CFR Part 15 Subpart C
RSS-247 Issue 2

Tested by:
Intertek Testing Services NA, Inc.
731 Enterprise Drive
Lexington, KY 40510

Client:
SPR Therapeutics, Inc.
22901 Millcreek Blvd, Suite 110
Cleveland, OH 44122

Report prepared by

Brian Lackey, Project Engineer

Report reviewed by

Bryan Taylor, Team Leader

This report is for the exclusive use of Intertek's Client and is provided pursuant to the agreement between Intertek and its Client. Intertek's responsibility and liability are limited to the terms and conditions of the agreement. Intertek assumes no liability to any party, other than to the Client in accordance with the agreement, for any loss, expense or damage occasioned by the use of this report. Only the Client is authorized to permit copying or distribution of this report and then only in its entirety. Any use of the Intertek name or one of its marks for the sale or advertisement of the tested material, product or service must first be approved in writing by Intertek. The observations and test results in this report are relevant only to the sample tested. This report by itself does not imply that the material, product, or service is or has ever been under an Intertek certification program.

1 Introduction and Conclusion

The tests indicated in section 2 were performed on the product constructed as described in section 3. The remaining test sections are the verbatim text from the actual data sheets used during the investigation. These test sections include the test name, the specified test method, a list of the actual test equipment used, documentation photos, results and raw data. No additions, deviations, or exclusions have been made from the standard(s) unless specifically noted.

Based on the results of our investigation, we have concluded the product tested complied with the requirements of the standard(s) indicated. The results obtained in this test report pertain only to the item(s) tested.

The INTERTEK-Lexington is located at 731 Enterprise Drive, Lexington Kentucky, 40510. The radiated emission test site is a 10-meter semi-anechoic chamber. The chamber meets the characteristics of CISPR 16-1 and ANSI C63.4. For measurements, a remotely controlled flush-mount metal-top turntable is used to rotate the EUT a full 360 degrees. A remote controlled non-conductive antenna mast is used to scan the antenna height from one to four meters. The test site is listed with the FCC under registration number 485103. The test site is listed with Industry Canada under site number IC 2042M-1.

2 Test Summary

Page	Test full name	FCC Reference	IC Reference	Result
6	Peak Output Power	§ 15.247(b)(1)	RSS-247 § 5.4(b)	Pass
9	Occupied Bandwidth	§ 15.247(a)(1)	RSS-247 § 5.2(a)	Pass
13	Time of Occupancy	§ 15.247(a)(1)(iii)	RSS-247 § 5.1(d)	Pass
16	Conducted Spurious Emissions	§ 15.247(d)	RSS-Gen § 7.1.3	Pass
19	Power Spectral Density	§ 15.247(e)	RSS-247 § 5.2(b)	Pass
19	Radiated Spurious Emissions (Transmitter)	§ 15.247(d), § 15.209, and § 15.205	RSS-247 § 5.5	Pass
30	Radiated Spurious Emissions (Receiver)	§ 15.109	RSS-Gen § 7.1.2	Pass
-	AC Mains Conducted Emissions	§ 15.107, § 15.207	RSS-Gen § 8.8	NA ¹
34	Antenna Requirement per FCC Part 15.203	§ 15.203	RSS-Gen § 8.3	Pass

¹ Test is not applicable. Device does not connect to AC mains.

3 Description of Equipment Under Test

Equipment Under Test	
Manufacturer	SPR Therapeutics, Inc.
Model Number	9610
Serial Number	17440002
Receive Date	11/10/2017
Test Start Date	11/10/2017
Test End Date	11/17/2017
Device Received Condition	Good
Test Sample Type	Production
Frequency Band	2402 – 2480MHz
Mode(s) of Operation	Bluetooth Low Energy (BTLE)
Modulation Type	DTS
Transmission Control	Test Commands
Maximum Output Power	8.44dBm
Test Channels	0, 19, 39
Antenna Type (15.203)	Internal
Operating Voltage	Battery

Description of Equipment Under Test
This is the body worn 2-channel pulse generator that provides stimulus current to 1 or 2 MicroLeads (Percutaneous Electrodes).

Operating modes of the EUT:

No.	Descriptions of EUT Exercising
1	Bluetooth low energy (BTLE) transmitting on low, mid, and high channels
2	Receive / idle mode

4 System setup including cable interconnection details, support equipment and simplified block diagram

4.1 EUT Block Diagram:

4.2 Cables:

No cables were used in this test configuration.

4.3 Support Equipment:

Support Equipment			
Description	Manufacturer	Model Number	Serial Number
Laptop	HP	-	-

5 Peak Output Power

5.1 Test Limits

§ 15.247(b): The maximum peak conducted output power of the intentional radiator shall not exceed the following:

(1) For frequency hopping systems operating in the 2400–2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725–5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400–2483.5 MHz band: 0.125 watts.

5.2 Test Procedure

ANSI C63.10: 2013. The peak output power was measured using the marker to peak function of the spectrum analyzer.

5.3 Test Equipment Used

Description	Serial Number	Manufacturer	Model	Cal. Date	Cal. Due
EMI Test Receiver	10887490.26	Rohde & Schwarz	ESI26	9/20/2017	9/20/2018

5.4 Test Results

The device was found to be **compliant**. The output power was less than the limit.

5.5 Test Conditions

Test Personnel: Brian Lackey
Supervising/Reviewing
Engineer:
(Where Applicable) NA
Input Voltage: Battery

Test Date: 11/10/2017
Ambient Temperature: 22.1C
Relative Humidity: 35.2%
Atmospheric Pressure: 992.0mbar

5.6 Test Data

Channel	Frequency (MHz)	Output Power (mW)	Limit (mW)	Pass / Fail
0	2402	5.71	125	Pass
19	2440	6.78	125	Pass
39	2480	6.98	125	Pass

Max Output Power Channel 0

Max Output Power Channel 19

Max Output Power Channel 39

6 Occupied Bandwidth

6.1 Test Limits

§ 15.247(a): Operation under the provisions of this Section is limited to frequency hopping and digitally modulated intentional radiators that comply with the following provisions:

(1) Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

6.2 Test Procedure

ANSI C63.10: 2013.

6.3 Test Equipment Used

Description	Serial Number	Manufacturer	Model	Cal. Date	Cal. Due
EMI Test Receiver	10887490.26	Rohde & Schwarz	ES126	9/20/2017	9/20/2018

6.4 Test Results

The 20dB bandwidth measurements are shown below. A 99% bandwidth measurement was also performed.

Channel	Frequency (MHz)	6dB Bandwidth (MHz)	20dB Bandwidth (MHz)
0	2402	0.731	1.222
19	2440	0.731	1.222
39	2480	0.721	1.212

6.5 Test Conditions

Test Personnel: Brian Lackey
Supervising/Reviewing
Engineer:
(Where Applicable) NA
Input Voltage: Battery

Test Date: 11/10/2017
Ambient Temperature: 22.1C
Relative Humidity: 35.2%
Atmospheric Pressure: 992.0mbar

99% Bandwidth, Channel 39

7 Time of Occupancy

7.1 Test Limits

§ 15.247(a): Operation under the provisions of this Section is limited to frequency hopping and digitally modulated intentional radiators that comply with the following provisions:

(1)(iii) Frequency hopping systems in the 2400–2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used

7.2 Test Procedure

ANSI C63.10: 2013.

7.3 Test Equipment Used

Description	Serial Number	Manufacturer	Model	Cal. Date	Cal. Due
EMI Test Receiver	10887490.26	Rohde & Schwarz	ESI26	9/20/2017	9/20/2018

7.4 Test Results

The device was found to be **compliant**. The time of occupancy was less than the limit.

7.5 Test Conditions

Test Personnel: Brian Lackey
Supervising/Reviewing
Engineer:
(Where Applicable) NA
Input Voltage: Battery

Test Date: 11/14/2017
Ambient Temperature: 21.2C
Relative Humidity: 29.7%
Atmospheric Pressure: 985.4mbar

7.6 Test Data

Mode	Number of Transmissions in a 16s Frame (80 Hopping Ch x 0.4s)	Transmission Time (ms)	Result (ms)	Limit (ms)
BTLE	2 (times in 0.4sec) * (16sec / 0.4sec) = 80	0.0921	7.368	400
Time of occupancy = Transmission Time x Number of Transmissions				

Dwell Time, BTLE

Dwell Time (Single Pulse)

8 Conducted Spurious Emissions

8.1 Test Limits

§ 15.247(d): In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

8.2 Test Procedure

ANSI C63.10: 2013.

8.3 Test Equipment Used

Description	Serial Number	Manufacturer	Model	Cal. Date	Cal. Due
EMI Test Receiver	10887490.26	Rohde & Schwarz	ESI26	9/20/2017	9/20/2018

8.4 Test Results

The device was found to be **compliant**. The following plots show that there are no conducted spurious emissions exceeding the 20dB down criteria. Plots are also presented showing the band edge compliance.

8.5 Test Conditions

Test Personnel: Brian Lackey
Supervising/Reviewing
Engineer:
(Where Applicable) NA
Input Voltage: Battery

Test Date: 11/10/2017

Conducted Spurious Emissions at Antenna Port Channel 0

Conducted Spurious Emissions at Antenna Port Channel 19

Conducted Spurious Emissions at Antenna Port Channel 39

Band Edge Plot

9 Power Spectral Density

9.1 Test Limits

§ 15.247(e): For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission. This power spectral density shall be determined in accordance with the provisions of paragraph (b) of this section. The same method of determining the conducted output power shall be used to determine the power spectral density.

9.2 Test Procedure

ANSI C63.10: 2013.

9.3 Test Equipment Used

Description	Serial Number	Manufacturer	Model	Cal. Date	Cal. Due
EMI Test Receiver	10887490.26	Rohde & Schwarz	ES126	9/20/2017	9/20/2018

9.4 Test Results

The device was found to be **compliant**. The peak power spectral density was less than the limit.

Power Spectral Density – Channel 19

Power Spectral Density – Channel 39

10 Radiated Spurious Emissions (Transmitter)

10.1 Test Limits

§ 15.247(d): In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

Part 15.205(a): Restricted Bands of Operations

MHz	MHz	MHz	GHz

Part 15.209(a): Field Strength Limits for Restricted Bands of Operation

Frequency (MHz)	Field Strength (microvolts/meter)	Measurement Distance (meters)
0.009 - 0.490	2,400 / F (kHz)	300
0.490 - 1.705	24,000 / F (kHz)	30
1.705 - 30.0	30	30
30 - 88	100	3
88 - 216	150	3
216 - 960	200	3
Above 960	500	3

10.2 Test Procedure

ANSI C63.10: 2013.

10.3 Example of Field Strength Calculation Method

The measured field strength was calculated by summing the readings taken from the spectrum analyzer with the appropriate correction factors associated with the antenna losses and cable losses. The calculation formula and sample calculations are listed below:

Formula:

$$FS = RA + AF + CF$$

FS = Field Strength in dB μ V/m

RA = Receiver Amplitude in dB μ V

AF = Antenna Factor in dB

CF = Cable Attenuation Factor in dB (Including preamplifier and filter attenuation)

Example Calculation:

RA = 19.48 dB μ V

AF = 18.52 dB

CF = 0.78 dB

$FS = 19.48 + 18.52 + 0.78 = 38.78$ dB μ V/m

Level in μ V/m = Common Antilogarithm $[(38.78 \text{ dB}\mu\text{V/m})/20] = 86.89 \mu\text{V/m}$

10.4 Test Equipment Used

10.5 Test Results

The device was found to be **compliant**. All spurious emissions were attenuated by at least 20dB below the level of the fundamental as required by Part 15.247(d). Additionally, all emissions falling within restricted bands of operation and at the band edges were found to be below the limit specified in Part 15.209(a). The spurious emissions listed in the following table are the worst case emissions.

18-40GHz spurious emissions data, representative of the worst case of all transmission modes measured in 3 orthogonal axes.

11 Radiated Spurious Emissions (Receiver)

11.1 Test Limits

§ 15.109: Except for Class A digital devices, the field strength of radiated emissions from unintentional radiators at a distance of 3 meters shall not exceed the following values:

Frequency of emission (MHz)	Field strength (microvolts/meter)	Field strength (dBuV/m)
30–88	100	40
88–216	150	43.5
216–960	200	46
Above 960	500	54

These limits are identical to those in RSS-GEN

11.2 Test Procedure

ANSI C63.4: 2014

11.3 Example of Field Strength Calculation Method

The measured field strength was calculated by summing the readings taken from the spectrum analyzer with the appropriate correction factors associated with the antenna losses and cable losses. The calculation formula and sample calculations are listed below:

Formula:

$$FS = RA + AF + CF$$

FS = Field Strength in dB μ V/m

RA = Receiver Amplitude in dB μ V

AF = Antenna Factor in dB

CF = Cable Attenuation Factor in dB (Including preamplifier and filter attenuation)

Example Calculation:

RA = 19.48 dB μ V

AF = 18.52 dB

CF = 0.78 dB

$$FS = 19.48 + 18.52 + 0.78 = 38.78 \text{ dB}\mu\text{V/m}$$

$$\text{Level in } \mu\text{V/m} = \text{Common Antilogarithm} [(38.78 \text{ dB}\mu\text{V/m})/20] = 86.89 \mu\text{V/m}$$

11.4 Test Equipment Used

11.5 Test Results

All spurious emissions with the test sample in receive mode were below the limits specified in Part 15.109 for a class B digital device and RSS-GEN Section 6.1. All peak detected emissions were at least 15dB below the limit.

11.6 Test Conditions

Test Personnel: Brian Lackey
 Supervising/Reviewing Engineer:
 (Where Applicable) NA
 Input Voltage: Battery

Test Date: 11/13/2017
 Ambient Temperature: 20.6C
 Relative Humidity: 36.1%
 Atmospheric Pressure: 988.8mbar

11.7 Test Data

12 Antenna Requirement per FCC Part 15.203

12.1 Test Limits

§ 15.203: An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to carrier current devices or to devices operated under the provisions of §15.211, §15.213, §15.217, §15.219, or §15.221. Further, this requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with §15.31(d), must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this part are not exceeded.

12.2 Test Results

The sample tested met the antenna requirement. The antenna used was internal to the sample and permanently attached to the PCB.

12.3 Test Conditions

Test Personnel: Brian Lackey
Supervising/Reviewing
Engineer:
(Where Applicable) NA
Input Voltage: Battery

Test Date: 11/13/2017
Ambient Temperature: 20.6C
Relative Humidity: 36.1%
Atmospheric Pressure: 988.8mbar

13 Measurement Uncertainty

The measured value related to the corresponding limit will be used to decide whether the equipment meets the requirements.

The measurement uncertainty figures were calculated and correspond to a coverage factor of $k = 2$, providing a confidence level of respectively 95.45 % in the case where the distributions characterizing the actual measurement uncertainties are normal (Gaussian).

Measurement uncertainty Table

Parameter	Uncertainty	Notes
Radiated emissions, 30 to 1000 MHz	+3.9dB	
Radiated emissions, 1 to 18 GHz	+4.2dB	
Radiated emissions, 18 to 40 GHz	+4.3dB	
Power Port Conducted emissions, 150kHz to 30 MHz	± 2.8 dB	

14 Revision History

Revision Level	Date	Report Number	Notes
0	11/27/2017	103291273LEX-016	Original Issue
1	5/9/2018	103291273LEX-016.1	Added 18-40GHz radiated emissions data.
2	5/17/2018	103291273LEX-016.2	Removed FHSS data. Added 6dB Bandwidth.
