1 INFORMATION

1.1 Test Item

Name :	Multiplex
FCC ID :	2APABQBASE
Industry Canada ID :	23810-QBASE
Model/version :	QBaseModem
Frequency Range :	902 - 928 MHz
Tunable Bands :	None
Number of Channels:	100
Operating Modes :	Transceiver
Type of Modulation :	FHSS / FSK
User Frequency Adjustment :	None
Output Power (radiated):	269.23 mW
Type of Power Supply Ground modem:	5Vdc (USB) via AC/DC converter with USB connector
Type of Power Supply Air modem:	6.4Vdc via LiFePo Battery with two cells
Antenna Connector :	SMA-RP (Ground modem) / fixed (Air modem)
Antenna Diversity Supported :	No

Description of Test Item

The EUT is a transceiver, operating in the 915 MHz band. It is designed for high performance data transmission over long distances. The EUT uses a standard TTL UART interface for Data communication. The EUT can be soldered onto two different supporting PCBs. A voltage regulator 5V dc to 3.3V dc, interface connector and RF connector is located on each supporting PCB. Communication is bi-directional.

Theory of Operation

The QBaseModem is a bidirectional FHSS-system with 100 channels. The Modem is hopping over 50 channels. The user can select using the lower 50 channels (1 to 50) or the upper 50 channels (51 to 100)

1.2 Normal test conditions

Temperature: 20 - 26 °C
Relative humidity: 45 - 55 %
Normal test voltage: 5.0 Vdc (Ground modem); 6.4 Vdc (Air modem)

The values are the limit registered during the test period. All tests were performed with fully charged batteries.

1.6 Antenna Requirement (Ground modem)

Is the antenna detachable?

☒ Yes ☐ No

If detachable, is the antenna connector non-standard?

☒ Yes ☐ No

Type of antenna connector: SMA-RP

Ref. FCC §15.203

1.7 Antenna Requirement (Air modem)

Is the antenna detachable?

☐ Yes ☒ No

If detachable, is the antenna connector non-standard?

☐ Yes ☐ No

Type of antenna connector: -

Ref. FCC §15.203

1.8 Worst-Case Configuration and Mode

Radiated Emissions was performed with the EUT set to transmit at the channel with the highest output power as worst-case scenario.

1.9 Test Setup Configuration

The EUT can be soldered onto two different supporting PCBs. Because the RF connector is located on the supporting PCB, two different setup configurations have been fully tested.

- 1.) Air modem setup:
Radio module soldered onto the supporting PCB (Air).
Supporting PCB contains voltage regulation, RF-connector, data connector and RF-ground plane. Power supply via fully charged LiFePo Battery with two cells (6.4 Vdc).
Radiated spurious emissions measured with 50Ohm terminator at the antenna port.
- 2.) Ground modem setup:
Radio module soldered onto the supporting PCB (Ground).
Supporting PCB contains voltage regulation, RF-connector, USB converter and USB connector. Power supply via AC/DC converter with USB connector.
Radiated spurious emissions measured with 50Ohm terminator at the antenna port.

1.10 Comments

And the output level is set to maximum in the software.

The radiated measurements are tested on three axes.

All ports were populated during spurious emission and power line conducted measurements.

At the Ground modem, the measurements were done with the EUT powered by 115 V AC. It was checked that power variations between 85% and 115% did not have any influence on the measurements.

2 TEST REPORT SUMMARY

2.1 General

All measurements are traceable to national standards.

The tests were conducted for the purpose of demonstrating compliance with FCC CFR 47 Part 15, paragraph 15.247 and Industry Canada RSS-247 Issue 2.

Tests were performed in accordance with ANSI C63.4-2014 and ANSI C63.10-2013.

Radiated tests were performed in a semi-anechoic shielded room ($f < 1$ GHz) and a fully-anechoic shielded room ($f > 1$ GHz) at a measuring distance of 3m.

A description of the test facility is on file with the FCC and Industry Canada.

3.3 Pseudorandom Hopping Algorithm

Para. No.: 15.247 (a)(1)

Test Results: Complies

Measurement Data:

At the transceiver startup, a random hopping table is generated in the software by using non-deterministic, random data. The table ensures that all generated hopping sequences are evenly distributed and that all frequencies are used equally. The random data itself is created by a random generator within the software. The used algorithm ensures the randomness of the generated sequences as well as the selection of the sequence being used. It can be ensured, that each hopping sequence is unique and that the sequence of two transceivers will always differ from each other.

Requirements:

The channel frequencies shall be selected from a pseudorandom ordered list of hopping frequencies. Each frequency must be used equally by the transmitter.

No requirements for Digital Transmission Systems.

Antenna gain = $10 \cdot \log(\text{EIRP}/\text{Conducted power})$ dBi

EIRP is calculated from measured field strength by the formulas in KDB 412172 D01 Determining ERP and EIRP v01.

The maximum field strength is obtained in XY plane and Vertical polarization

Type of antenna connector: SMA-RP

Requirements:

The maximum peak output power shall not exceed the following limits:

For frequency hopping systems employing at least 50 hopping channels: 1 Watt

If transmitting antennas of directional gain greater than 6 dBi are used, the peak output power from the intentional radiator shall be reduced below the stated value above by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

3.8 Restricted Bands of operation

Restricted Bands of operation for FCC and ISSED are defined in FCC Part 15.205 and ISSED RSS-GEN, Issue 4 clause 8.10.

Generally, no fundamentals are allowed in the restricted bands and all emissions must comply with the limits in FCC 15.209 or RSS-GEN, Issue 4, clause 8.9.

3.9 Spurious Emissions (Radiated)

Para. No.: 15.247 (c)

Test Performed By: Markus Korny	Date of Test: 2018-08-24 to 2018-09-07
---------------------------------	--

Test Results: Complies

Duty Cycle Correction Factor Calculation:

Duty Cycle = On Time / (Period * Number of Channels) = 5.84 ms / (9.32 ms * 50) = 0.0125

Duty Cycle Correction factor = -20 x log (Duty Cycle) = 38.0 dB

Maximum allowed Duty Cycle Correction: 20 dB

Plots see chapter 3.4.

Radiated emissions 10 kHz-30 MHz.

Measuring distance 3 m, measured with Peak detector.

No component detected, see attached graph.

Limit is converted to 3 m using 40 dB/decade according to 15.31 (f) (2).
