1. EQUIPMENT RECEIVED AND TESTED

EQUIPMENT: QNext

Brand:	GRIFOLS	Model:	215550
s/n:	prototype	Power Supply:	AC 120 VAC 60Hz
SW version:	Test Software	HW Version:	1.0

* **Note:** The equipment with model number 215550 is equivalent to the equipment with model number DG 518

Test product reception:	2018-03-12
Test initial date:	2018-03-12
Test final date:	2018-03-14

1.1. Test configuration

Power Supply:	AC 120 VAC 60Hz
Set-up:	Tabletop
Test exercise:	Equipment continuously operating with two Tag readers of 125KHz and a RFID module of 13.56 MHz working.
Equipment size:	930 x 660 x 520 mm

1.2. Auxiliary and control equipment

Keyboard and mouse
Personal Computer Brand Dell Inspiron 8400

1.3. Input/output wires

Shielded LAN cable Cat VI length 3m.

2. APPLICABLE STANDARDS

2.1. TEST APPLICABLE STANDARDS

Standard: FCC Title 47 part 15 Subpart C & RSS-Gen Issue 5, April 2018 and ANSI C63.10 based on standards.

Basic standard: FCC Title 47 part 15 Subpart C & RSS-Gen Issue 5, April 2018 and ANSI C63.10

☒ Radio-frequency radiated emissions (9kHz -18000MHz)

Co-Location Testing: *In order to satisfy test requirements for multiple transmitters, co-location testing was performed during this test where the 125kHz tag readers and 13.56MHz RFID module were working simultaneously*

Basic standard: FCC Title 47 part 15 Subpart C & RSS-Gen Issue 5, April 2018 and ANSI C63.10

☒ Power line conducted emissions (0,15-30MHz)

Basic standard: FCC Title 47 part 15 Subpart C & RSS-Gen Issue 5, April 2018 and ANSI C63.10

☒ Antenna Requirements

2.1.1. Acceptance criteria for the test

According to standard **FCC Title 47 part 15 Subpart C & RSS-Gen Issue 5, April 2018 and ANSI C63.10**

2.2. Test facilities ID

FCC Test Firm Registration Number: 507478
ISED Assigned Code: 5766A

2.3. Test procedures

Radio-frequency radiated emissions: C5401665
Power line conducted emissions: C5401665
Antenna Requirements C5401665

2.4. Measuring uncertainties

Radio-frequency radiated emissions: $\pm 4,3$ dB
Power line conducted emissions: $\pm 2,1$ dB

Expanded uncertainty measurement is obtained multiplying the typical uncertainty measurement with a coverage factor $k=2$, which corresponds to a confidence level of 95% for a normal distribution. The typical uncertainty measurement has been determined in accordance with document EA-4/02.

2.5. Modifications

No modifications were made.

2.6. USED EQUIPMENT

Power line conducted emissions.		Pass	Note: 4
Antenna Requirements		Pass	N / A
1: The measured results are above the upper limit, even considering the uncertainty interval. 2: The measured results are above the specified limits, but within the uncertainty interval. It is therefore not possible to state compliance based on the 95% level of confidence. However, the results indicate that non-compliance is more probable than compliance 3: The measured results are below the specified limits, but within the uncertainty interval. It is therefore not possible to state compliance based on the 95% level of confidence. However, the results indicate that compliance is more probable than non-compliance 4: The measured results are within the limits, including the uncertainty interval.			

Service Quality Assurance

Applus+, guarantees that this work has been made in accordance with our Quality and Sustainability System, fulfilling the contractual conditions and legal norms.

Within our improvement program we would be grateful if you would send us any commentary that you consider opportune, to the person in charge who signs this document, or to the Quality Manager of Applus+, in the following e-mail address: satisfaccion.cliente@applus.com

4. ANNEXES

4.1. Test Results

4.1.1. Radiated Emissions

The test site semi-anechoic chamber has met the requirement of NSA tolerance 4 dB according to the standards: ANSI C63.10-2013. The test distance is 3m. The setup is according to the requirements in Section 13.1.4.1 of ANSI C63.10-2013.

According to FCC Part 15.247(d): radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)). According to FCC Part 15.205, Restricted bands.

MHz	MHz	MHz	GHz
0.090-0.110	16.42-16.423	399.9-410	4.5-5.15
10.495-0.505	16.69475-16.69525	608-614	5.35-5.46

13.36-13.41			

20dBc in any 100 kHz bandwidth outside the operating frequency band. In case the emission fall within the restricted band specified on 15.205(a), then the 15.209(a) limit in the table below has to be followed.

Restricted Frequency(MHz)	Field Strength (μV/m)	Field Strength (dBμV/m)	Measurement Distance
0.009~0.490	2400/F(KHz)	20 log (uV/m)	300
0.490~1.705	2400/F(KHz)	20 log (uV/m)	30
1.705~30.0	30	29.5	30
30-88	100	40	3
88-216	150	43.5	3
216-960	200	46	3
Above 960	500	54	3

Limits of Radiated Emission Measurement(Above 1000MHz)

Frequency(MHz)	Class B (dBuV/m) (at 3M)	
	PEAK	AVERAGE
Above 1000	74	54

Test Configuration

- For radiated emissions below 30MHz:

- For radiated emissions from 30MHz to 1000MHz:

- For radiated emissions above 1000MHz:

Test Procedures

The measuring distance of at 3 m shall be used for measurements at frequency up to 1GHz. For frequencies above 1GHz, any suitable measuring distance may be used.

The EUT was placed on the top of a rotating table 0.8 m for below 1GHz and 1.5m for above 1GHz the ground at a 3 meter. The table was rotated 360 degrees to determine the position of the highest radiation.

The height of the equipment or of the substitution antenna shall be 0.8 m for below 1GHz and 1.5m for above 1GHz; the height of the test antenna shall vary between 1 m to 4 m. Both horizontal and vertical polarizations of the antenna are set to make the measurement.

For the radiated emission test above 1GHz:

Place the measurement antenna away from each area of the EUT determined to be a source of emissions at the specified measurement distance, while keeping the measurement antenna aimed at the source of emissions at each frequency of significant emissions, with polarization oriented for maximum response. The measurement antenna may have to be higher or lower than the EUT, depending on the radiation pattern of the emission and staying aimed at the emission source for receiving the maximum signal. The final measurement antenna elevation shall be that which maximizes the emissions. The measurement antenna elevation for maximum emissions shall be restricted to a range of heights of from 1 m to 4 m above the ground or reference ground plane.

The initial step in collecting conducted emission data is a spectrum analyzer peak detector mode pre-scanning the measurement frequency range. Significant peaks are then marked and then Quasi Peak detector mode re-measured.

If the Peak Mode measured value compliance with and lower than Quasi Peak Mode Limit, the EUT shall be deemed to meet QP Limits and then no additional QP Mode measurement performed.

For the actual test configuration, please refer to the related Item –EUT Test Photos.

Note: Both horizontal and vertical antenna polarities were tested and performed pretest to three orthogonal axis. The worst case emissions were reported.

During the radiated emission test, the Spectrum Analyzer was set with the following configurations:

Frequency Band (MHz)	Function	Resolution bandwidth	Video Bandwidth
30 to 1000	QP	120 kHz	300 kHz
Above 1000	Peak	1 MHz	1 MHz
	Average	1 MHz	10 Hz

Note: for the frequency ranges below 30 MHz, a narrower RBW is used for these ranges but the measured value should add a RBW correction factor (RBWCF) where $RBWCF [dB] = 10 \cdot \lg(100 [kHz] / \text{narrower RBW [kHz]})$. the narrower RBW is 1 kHz and RBWCF is 20 dB for the frequency 9 kHz to 150 kHz, and the narrower RBW is 10 kHz and RBWCF is 10 dB for the frequency 150 kHz to 30 MHz.

Comments:

*Measurement Level = Reading Level + Correct Factor

4.1.2. Conducted Emissions

Limit of Conducted Emissions

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average
0.15-0.5	66 to 56*	56 to 46*
0.5-5	56	46
5-30	60	50

*Decreases with the logarithm of the frequency.

Test Procedures

1. The device is placed on a test table, raised 80 cm above the reference ground plane. The vertical conducting plane is located 40 cm to the rear of the device.
2. The device is connected to line impedance stabilization network (LISN) and other accessories are connected to other LISN. Measured levels of AC power line conducted emission are across the 50 Ω LISN port.
3. AC conducted emission measurements are made over frequency range from 150 kHz to 30 MHz.
4. This measurement was performed with AC 120V/60Hz

Test Setup

Note 1: Support units were connected to second LISN.

Note 2: Both of LISNs are 80 cm from EUT and at least 80 cm from other units and other metal planes.

4.1.3. Antenna Requirements

ANTENNA REQUIREMENTS	
Device under test: QNext Model: 215550 Test disposition: Tabletop Auxiliary equipment: Keyboard and mouse Personal Computer Brand Dell Inspiron 8400 DUT exercise: Equipment continuously operating with two Tag readers of 125KHz and a RFID module of 13.56 MHz working	Brand: GRIFOLS Serial number: prototype Supply: AC 120 VAC 60Hz Input/output cable: Shielded LAN cable Cat VI length 3m.
Basic standard: FCC Title 47 part 15 Subpart C & RSS-Gen Issue 5, April 2018 and ANSI C63.10	
Procedure: C5401665	
RESULTS: Pass	
Comments: Excerpt from 15.203 of the FCC Rules/Regulations: "An intentional radiator antenna shall be designed to ensure that no antenna other than furnished by the responsible party can be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section." The antennas of the Insert Equipment Tested are permanently attached. There are no provisions for connection to an external antenna.
