General Remarks:		
The test results presented in this report relate only to the object tested. The results contained in this report reflect the results for this particular model and serial number. It is the responsibility of the manufacturer to ensure that all production models meet the intent of the requirements detailed within this report. This report shall not be reproduced, except in full, without the written approval of the Issuing testing laboratory.		
Additional Comments:		
The power settings of the module have been reduced by 8.5 dB (compared to the basic settings; via software settings).

1.7 Sample emission level calculation

The following is a description of terms and a sample calculation, as appears in the radiated emissions data table. The numbers used in the calculation are for example only. There is no direct correlation to the specific data taken for the product described in this document:

Reading:

This is the reading obtained on the spectrum analyzer in dBμV. Any external preamplifiers used are taken into account through internal analyzer settings.

A.F.:

This is the antenna factor for the receiving antenna. It is a conversion factor, which converts electric fields strengths to voltages, which can be measured directly on the spectrum analyzer. It is treated as a loss in dB. Cable losses have been included with the A.F. to simplify the calculations. The antenna factor is used in calculations as follows:

$$\text{Reading on Analyzer (dB}\mu\text{V)} + \text{A.F. (dB/m)} = \text{Net field strength (dB}\mu\text{V/m)}$$

Net:

This is the net field strength measurement (as shown above).

Limit:

This is the FCC Class B radiated emission limit (in units of dBμV/m). The FCC limits are given in units of μV/m. The following formula is used to convert the units of μV/m to dBμV/m:

$$\text{Limit (dB}\mu\text{V/m)} = 20 \cdot \log(\mu\text{V/m})$$

Margin:

This is the margin of compliance below the FCC limit. The units are given in dB. A negative margin indicates the emission was below the limit. A positive margin indicates that the emission exceeds the limit.

Example only:

Reading + AF	= Net Reading	:	Net reading - FCC limit	= Margin
+21.5 dBμV + 26 dB/m	= 47.5 dBμV/m	:	47.5 dBμV/m - 57.0 dBμV/m	= -9.5 dB

3.2.5 Procedure

Test Procedure	
1.	EUT set to test mode
2.	The turntable and antenna polarization are set to the maximum emission level for the fundamental emission of the EUT
3.	Span is set so that the complete fundamental emission spectrum is captured
3.	Resolution bandwidth set to 1 MHz and the VBW is set to 3 MHz with peak detector and max. hold
4.	The emission spectrum is corrected by the antenna gain cable loss, low-noise amplifier gain
5.	The maximum of the spectrum envelope is determined as reference
6.	The spectrum is searched from the left edge to the center of the spectrum in order to find the lower -10 dB frequency
7.	The spectrum is searched from the right edge to the center of the spectrum in order to find the upper -10 dB frequency
8.	From the lower and upper frequency the center frequency, the -10 dB bandwidth and the fractional bandwidth are calculated

3.4.2 Limits

Limits - FCC
A UWB device shall transmit only when it is sending information to an associated receiver. The UWB intentional radiator shall cease transmission within 10 seconds unless it receives an acknowledgement from the associated receiver that its transmission is being received. An acknowledgment of reception must continue to be received by the UWB intentional radiator at least every 10 seconds or the UWB device must cease transmitting.

Limits - ISED
The device is to transmit only when it is sending information to an associated receiver. The device shall cease transmission of information within 10 seconds unless it receives an acknowledgement from the associated receiver that its transmission is being received. An acknowledgment of reception must continue to be received by the UWB device at least every 10 seconds or the UWB device shall cease transmitting any information other than periodic signals used for the establishment or re-establishment of a communication link with an associated receiver.

3.4.5 Procedure

Test Procedure	
1.	EUT set to normal operation
2.	The emissions of the EUT are captured with a spectrum analyzer
3.	The transmitter is stopped either by switching off the companion device or by releasing the manual switch
4.	From the moment the transmitter is released the emission are recorded and a marker is set to the moment the transmitter has switched off
5.	The marker time is recorded and compared to the limit

3.6.5 Procedure

Test Procedure 30 - 1000 MHz	
1. EUT is placed on a non conducting support at the center of a turn table 0.8 m above the ground 2. EUT set to test mode 3. The receiver is set to peak detection with max hold 4. The EUT is rotated through 360° and the height of the antenna is varied from 1 m to 4 m 5. All significant emissions are measured again using the corresponding final detector	

Test Procedure > 1 GHz	
1. EUT is placed on a non conducting support at the center of a turn table 1.5 m above the ground 2. EUT set to test mode 3. The receiver is set to peak detection with max hold 4. The EUT is rotated through 360° and the height of the antenna is varied from 1 m to 4 m 5. All significant emissions are measured again using the corresponding final detector

 Test Date: 2018-09-28
 Note:

Index 52

Frequency	Peak	Peak Limit	Peak Difference	Status
10.585 GHz	42.77 dBµV/m	53.98 dBµV/m	-11.21 dB	Pass

Spurious emissions according to RSS-Gen Issue 4

Project number: G0M-1806-7488

Applicant: Atlas Copco Industrial Technique A
 EUT Name: Industrial Location Tethering - Positioning System
 Model: IL-R
 Test Site: Eurofins Product Service GmbH
 Operator: Toralf Jahn
 Test Conditions: Tnom: 23.7°C, Vnom:
 Antenna: Schwarzbeck BBHA 9120D, Horizontal
 Measurement distance: 1 m converted to 3m
 Mode: RX; Rx UWB, channel 5
 Test Date: 2018-09-28
