Competences and guarantees

DEKRA Testing and Certification S.A.U. is a testing laboratory accredited by the National Accreditation Body (ENAC -Entidad Nacional de Acreditación), to perform the tests indicated in the Certificate No. 51/LE 147.

DEKRA Testing and Certification S.A.U. is an FCC-recognized accredited testing laboratory with the appropriate scope of accreditation that covers the performed tests in this report.

DEKRA Testing and Certification S.A.U. is an ISED-recognized accredited testing laboratory, CABid: ES1909, Company Number: 4621A, with the appropriate scope of accreditation that covers the performed tests in this report.

In order to assure the traceability to other national and international laboratories, DEKRA Testing and Certification S.A.U. has a calibration and maintenance program for its measurement equipment.

DEKRA Testing and Certification S.A.U. guarantees the reliability of the data presented in this report, which is the result of the measurements and the tests performed to the item under test on the date and under the conditions stated on the report and, it is based on the knowledge and technical facilities available at DEKRA Testing and Certification S.A.U. at the time of performance of the test.

DEKRA Testing and Certification S.A.U. is liable to the client for the maintenance of the confidentiality of all information related to the item under test and the results of the test.

The results presented in this Test Report apply only to the particular item under test established in this document.

IMPORTANT: No parts of this report may be reproduced or quoted out of context, in any form or by any means, except in full, without the previous written permission of DEKRA Testing and Certification S.A.U.

General conditions

1. This report is only referred to the item that has undergone the test.
2. This report does not constitute or imply on its own an approval of the product by the Certification Bodies or competent Authorities.
3. This document is only valid if complete; no partial reproduction can be made without previous written permission of DEKRA Testing and Certification S.A.U.
4. This test report cannot be used partially or in full for publicity and/or promotional purposes without previous written permission of DEKRA Testing and Certification S.A.U. and the Accreditation Bodies.

Uncertainty

Uncertainty (factor $k=2$) was calculated according to the DEKRA Testing and Certification S.A.U. internal document PODT000.

Data provided by the client

The following data has been provided by the client:

1. Information relating to the description of the sample ("Identification of the item tested", "Trademark", "Model and/or type reference tested").
2. The sample of the model 32001505BUS is a LoRaWAN transceiver (US915 frequency plan).

DEKRA Testing and Certification S.A.U. declines any responsibility with respect to the information provided by the client and that may affect the validity of results.

Usage of samples

Samples undergoing test have been selected by: The client.

- Sample S/01 is composed of the following elements:

Control N°	Description	Model	Serial N°	Date of reception
69260B/012	TRX module	32001505BUS	--	2021/09/21

Sample S/01 has undergone the test(s): All tests indicated in Appendixes A and B.

Testing period and place

Test Location	DEKRA Testing and Certification S.A.U.
Date (start)	2021-10-21
Date (finish)	2022-01-14

Document history

Report number	Date	Description
69260RRF.002	2023-05-22	First release
69260RRF.002A1	2023-10-03	It is modified due to a change in the FCC ID field and antenna gain. This modification test report cancels and replaces the test report 69260RRF.002

Environmental conditions

In the control chamber, the following limits were not exceeded during the test:

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %

In the semianechoic chamber, the following limits were not exceeded during the test.

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %

In the chamber for conducted measurements, the following limits were not exceeded during the test:

Temperature	Min. = 15 °C Max. = 35 °C
Relative humidity	Min. = 20 % Max. = 75 %

Remarks and comments

The tests have been performed by the technical personnel: Jaime Barranquero and Javier Miguel Nadales.

TEST CONDITIONS

(*): Declared by the Applicant.

POWER SUPPLY (*):

Vnominal:	3 Vdc.
Type of Power Supply:	DC external power supply.

ANTENNA (*):

Type of Antenna:	External.
Maximum Declared Antenna Gain:	+3.3 dBi

TEST FREQUENCIES:

Low Channel:	903.0 MHz
Middle Channel:	907.8 MHz
High Channel:	914.2 MHz

Power setting used **19 dBm** with command used for test:

TX_SF12/500kHz

CONDUCTED MEASUREMENTS

The equipment under test was set up in a shielded room and it is connected to the spectrum analyser using a low loss RF cable. The reading of the spectrum analyser is corrected taking into account the cable loss.

The DC supply voltage is applied using an external calibrated power supply with a multimeter.

RADIATED MEASUREMENTS

All radiated tests were performed in a semi-anechoic chamber. The measurement antenna (Bilog antenna for the range between 30 MHz to 1000 MHz and 1 GHz-10 GHz Double ridge horn antenna) is situated at a distance of 3 m.

The equipment under test was set up on a non-conductive platform above the ground plane and the situation and orientation was varied to find the maximum radiated emission. It was also rotated 360° and the antenna height (Bilog antenna and Double ridge horn antenna) was varied from 1 to 4 meters to find the maximum radiated emission.

Measurements were made in both horizontal and vertical planes of polarization.

A resolution bandwidth/video bandwidth of 100 kHz/300 kHz was used for frequencies below 1 GHz and 1MHz/3MHz for frequencies above 1 GHz.

Radiated measurements setup from 30 MHz to 1 GHz:

Radiated measurements setup from 1 GHz to 10 GHz:

Occupied Bandwidth

RESULTS:

	Low Channel 903.0 MHz	Middle Channel 907.8 MHz	High Channel 914.2 MHz
99% bandwidth (MHz)	0.56	0.50	0.50
Measurement uncertainty (kHz)	<± 2.31		

- Low Channel:

- Middle Channel:

- High Channel:

FCC 15.247 (a)(2) / RSS-247 5.2. (a) 6 dB Bandwidth

SPECIFICATION:

The minimum 6 dB bandwidth shall be at least 500 kHz.

RESULTS:

	Low Channel 903.0 MHz	Middle Channel 907.8 MHz	High Channel 914.2 MHz
6 dB Spectrum bandwidth (kHz)	648.2	646.4	644.1
Measurement uncertainty (kHz)	<± 12.13		

Verdict: PASS

- Low Channel:

- Middle Channel:

- High Channel:

FCC 15.247 (b) / RSS-247 5.4. (d) Maximum output power and antenna gain

SPECIFICATION:

For systems using digital modulation in the 902-928 MHz band: 1 watt (30 dBm).
The e.i.r.p. shall not exceed 4 W (36 dBm) (Canada).

RESULTS:

The maximum conducted output power level in the fundamental emission was measured using the method according to point 11.9.2.2.2 “AVGSA-1” of ANSI C.63.10-2013.

The EIRP power (dBm) is calculated by adding the declared maximum antenna gain to the measured conducted power.

Maximum Declared Antenna Gain: +3.3 dBi

	Low Channel 903.0 MHz	Middle Channel 907.8 MHz	High Channel 914.2 MHz
Maximum Conducted Power (dBm)	18.70	18.65	18.51
Maximum EIRP Power (dBm)	22.00	21.95	21.81
Measurement uncertainty (dB)	<± 2.07		

The maximum directional gain of the antenna is less than 6 dBi and therefore the maximum output power is not required to be reduced from the stated values.

Verdict: PASS

- Low Channel:

- Middle Channel:

- High Channel:

FCC 15.247 (d) / RSS-247 5.5. Band-edge emissions compliance (Transmitter)

SPECIFICATION:

In any 100 kHz bandwidths outside the frequency band in which the intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

RESULTS:

- Low Channel:

Measurement uncertainty (dB) <± 2.99

Verdict: PASS

- High Channel:

Measurement uncertainty (dB) <± 2.99

Verdict: PASS

FCC 15.247 (e) / RSS-247 5.2. (b) Power spectral density

SPECIFICATION:

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

RESULTS:

The maximum power spectral density level in the fundamental emission was measured using the method according to point 11.10.3.” Method AVGPSD-1” of ANSI C.63.10-2013.

	Low Channel 903.0 MHz	Middle Channel 907.8 MHz	High Channel 914.2 MHz
Power Spectral Density (dBm)	6.96	6.82	6.37
Measurement uncertainty (dB)	<± 2.07		

Verdict: PASS

- Low Channel:

- Middle Channel:

- High Channel:

FCC 15.247 (d) / RSS-247 5.5. Emission limitations radiated (Transmitter)

SPECIFICATION:

Radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)/RSS-Gen):

Frequency Range (MHz)	Field strength ($\mu\text{V/m}$)	Field strength ($\text{dB}\mu\text{V/m}$)	Measurement distance (m)
0.009-0.490	2400/F(kHz)	-	300
0.490-1.705	24000/F(kHz)	-	30
1.705 - 30.0	30	-	30
30 - 88	100	40	3
88 - 216	150	43.5	3
216 - 960	200	46	3
960 - 10000	500	54	3

The emission limits shown in the above table are based on measurements employing CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

RSS-247: Attenuation below the general field strength limits specified in RSS-Gen is not required.

RESULTS:

The situation and orientation was varied to find the maximum radiated emission. It was also rotated 360° and the antenna height was varied from 1 to 4 meters to find the maximum radiated emission.

Measurements were made in both horizontal and vertical planes of polarization.

All tests were performed in a semi-anechoic chamber at a distance of 3 m for the frequency range 30 MHz-10 GHz.

The field strength is calculated by adding correction factor to the measured level from the spectrum analyzer. This correction factor includes antenna factor, cable loss and pre-amplifiers gain.

Frequency range 30 MHz - 1 GHz:

- LOW CHANNEL. Spurious frequencies closest to the limit:

Spurious Frequency (MHz)	Emission Level (dBμV/m)	Polarization	Detector
839.3680	37.52	V	Quasi peak
847.4190	37.49	V	Quasi peak
871.0385	41.97	V	Quasi peak
935.0585	39.51	V	Quasi peak

- MIDDLE CHANNEL. Spurious frequencies closest to the limit:

Spurious Frequency (MHz)	Emission Level (dBμV/m)	Polarization	Detector
599.9720	27.68	V	Quasi peak
843.7815	41.28	V	Quasi peak
875.7915	44.68	V	Quasi peak
907.8015	42.06	V	Quasi peak
913.3790	39.87	V	Quasi peak
939.8115	43.51	V	Quasi peak

- HIGH CHANNEL. Spurious frequencies closest to the limit:

Spurious Frequency (MHz)	Emission Level (dBμV/m)	Polarization	Detector
563.8395	26.33	V	Quasi peak
850.2320	39.70	V	Quasi peak
882.1935	45.77	V	Quasi peak
914.2520	38.44	V	Quasi peak
919.1505	38.42	V	Quasi peak
946.2135	43.71	V	Quasi peak

Measurement Uncertainty: $<\pm 4.94$ dB

Frequency range 1 - 10 GHz:

The results in the next tables show the maximum measured levels in the 1-10 GHz range.

Spurious frequencies with peak levels above the average limit (54 dBμV/m at 3 m) are measured with average detector for checking compliance with the average limit.

- LOW CHANNEL. Spurious frequencies closest to the limit:

Spurious frequency (GHz)	Emission Level (dBμV/m)	Polarization	Detector
1.8058	47.79	H	Peak

Radiated measurements setup from 30 MHz to 1 GHz:

Radiated measurements setup from 1 GHz to 10 GHz:

FCC 15.247 (a) (1) / RSS-247 5.1. (c) 20 dB Bandwidth and Carrier frequency separation

SPECIFICATION:

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

RESULTS:

	Low Channel 902.3 MHz	Middle Channel 908.5 MHz	High Channel 914.9 MHz
20 dB Spectrum Bandwidth (kHz)	140.85	140.19	139.91
99% Bandwidth (kHz)	126.33	126.51	126.57
Measurement uncertainty (kHz)	<±0.73		

Verdict: PASS

- Low Channel:

- Middle Channel:

- High Channel:

Carrier frequency separation

Carrier frequency separation: 200.00 kHz

The hopping channel carrier frequencies are separated by a minimum two-thirds of the 20 dB bandwidth of the hopping channel.

Verdict: PASS

FCC 15.247 (a)(1)(i) / RSS-247 5.1 (c) Number of hopping channels

SPECIFICATION:

For frequency hopping systems operating in the 902-928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies.

RESULTS:

Total number of hopping channels: 64

Verdict: PASS

FCC 15.247 (a)(1)(i) / RSS-247 5.1 (c) Time of occupancy (Dwell Time)

SPECIFICATION:

The average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period.

RESULTS:

- Time of Occupancy:

Nº of hops over the period	1
Average Time of Occupancy	397.4819 ms

Measurement uncertainty (ms)	<±11.57
------------------------------	---------

Verdict: PASS

FCC 15.247 (b) / RSS-247 5.4 (a) Maximum peak output power and antenna gain

SPECIFICATION:

For frequency hopping systems operating in the 902-928 MHz band: 1 watt for systems employing at least 50 hopping channels; and, 0.25 watts for systems employing less than 50 hopping channels.
The e.i.r.p. shall not exceed 4 W if the hopset uses 50 or more hopping channels.

RESULTS:

The EIRP power (dBm) is calculated by adding the maximum declared antenna gain to the measured conducted power.

Maximum Declared Antenna Gain: +3.3 dBi

	Low Channel 902.3 MHz	Middle Channel 908.5 MHz	High Channel 914.9 MHz
Maximum Peak Conducted Power (dBm)	18.08	18.91	16.87
Maximum EIRP Power (dBm)	21.38	22.21	20.17
Measurement uncertainty (dB)	<± 2.07		

The maximum directional gain of the antenna is less than 6 dBi and therefore the maximum output power is not required to be reduced from the stated values.

Verdict: PASS

- Low Channel:

- Middle Channel:

- High Channel:

FCC 15.247 (d) / RSS-247 5.5. Band-edge emissions compliance (Transmitter)

SPECIFICATION:

In any 100 kHz bandwidths outside the frequency band in which the intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

RESULTS:

- HOPPING ON:
- Low Frequency Section 902 MHz:

Verdict: PASS

- High Frequency Section 928 MHz:

Measurement uncertainty (dB)	<±2.57
------------------------------	--------

Verdict: PASS

- HOPPING OFF:
- Low Frequency Section 902 MHz:

Verdict: PASS

- High Frequency Section 908 MHz:

Measurement uncertainty (dB)	<±2.99
------------------------------	--------

Verdict: PASS

FCC 15.247 (d) / RSS-247 5.5. Emission limitations radiated (Transmitter)

SPECIFICATION:

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)/RSS-Gen):

Frequency Range (MHz)	Field strength (μV/m)	Field strength (dBμV/m)	Measurement distance (m)
0.009-0.490	2400/F(kHz)	-	300
0.490-1.705	24000/F(kHz)	-	30
1.705 - 30.0	30	-	30
30 - 88	100	40	3
88 - 216	150	43.5	3
216 - 960	200	46	3
960 - 25000	500	54	3

The emission limits shown in the above table are based on measurements employing CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

RSS-247. Attenuation below the general field strength limits specified in RSS-Gen is not required.

RESULTS:

The situation and orientation was varied to find the maximum radiated emission. It was also rotated 360° and the antenna height was varied from 1 to 4 meters to find the maximum radiated emission.

Measurements were made in both horizontal and vertical planes of polarization.

All tests were performed in a semi-anechoic chamber at a distance of 3 m for the frequency range 30 MHz-10 GHz.

The field strength is calculated by adding correction factor to the measured level from the spectrum analyzer. This correction factor includes antenna factor, cable loss and pre-amplifiers gain.

Frequency range 30 MHz - 1 GHz:

- LOW CHANNEL. Spurious frequencies closest to the limit:

Spurious Frequency (MHz)	Emission Level (dBμV/m)	Polarization	Detector
870.3110	42.59	V	Quasi peak
907.6560	39.29	V	Quasi peak
934.3310	41.34	V	Quasi peak

- MIDDLE CHANNEL. Spurious frequencies closest to the limit:

Spurious Frequency (MHz)	Emission Level (dBμV/m)	Polarization	Detector
844.4605	40.28	V	Quasi peak
876.5190	45.08	V	Quasi peak
913.0880	39.56	V	Quasi peak
940.4905	43.62	V	Quasi peak

- HIGH CHANNEL. Spurious frequencies closest to the limit:

Spurious Frequency (MHz)	Emission Level (dBμV/m)	Polarization	Detector
808.1340	34.85	V	Quasi peak
882.9210	45.38	V	Quasi peak
920.2175	40.66	V	Quasi peak
946.9410	42.15	V	Quasi peak

Measurement Uncertainty: $< \pm 4.94$ dB

Frequency range 1 - 10 GHz:

The results in the next tables show the maximum measured levels in the 1-10 GHz range.

Spurious frequencies with peak levels above the average limit (54 dBμV/m at 3 m) are measured with average detector for checking compliance with the average limit.

- LOW CHANNEL. Spurious frequencies closest to the limit:

Spurious frequency (GHz)	Emission Level (dBμV/m)	Polarization	Detector
1.8043 (*)	64.68	V	Peak
	60.73		Average
2.7067	52.42	V	Peak
3.6091	49.02	V	Peak
4.5115	43.28	V	Peak
8.1208	50.43	V	Peak
9.0235	53.76	V	Peak

(*): This spurious frequency is outside the restricted bands as defined in §15.205(a). The measured maximum carrier level at 3 m was 116.09 dBμV/m (Peak) so the spurious level is more than 20 dB below the carrier level

- MIDDLE CHANNEL. Spurious frequencies closest to the limit:

Spurious frequency (GHz)	Emission Level (dBμV/m)	Polarization	Detector
1.8169	47.52	H	Peak
2.7253	52.35	V	Peak
3.6340	53.63	V	Peak
4.5427	45.99	V	Peak
6.3595	49.54	V	Peak
7.2679	50.79	V	Peak
8.1676	53.24	V	Peak
9.0850	55.33	V	Peak
	51.47		Average
9.9937	54.74	V	Peak
	46.87		Average

- HIGH CHANNEL. Spurious frequencies closest to the limit:

Spurious frequency (GHz)	Emission Level (dBμV/m)	Polarization	Detector
1.8298 (*)	62.55	V	Peak
	62.19		Average
2.7448	54.38	H	Peak
	39.64		Average
3.6595	44.85	H	Peak
4.5739	42.64	H	Peak
7.3192	47.75	V	Peak
8.2342	48.01	V	Peak
9.1489	52.06	V	Peak

(*): This spurious frequency is outside the restricted bands as defined in §15.205(a). The measured maximum carrier level at 3 m was 116.54 dBμV/m (Peak) so the spurious level is more than 20 dB below the carrier level.

Measurement Uncertainty: $<\pm 4.28$ dB

Verdict: PASS

Spectrum analyzer parameters:

Subrange	Step Size	Detectors	Bandwidth	Sweep Time	Preamp
30 MHz - 1 GHz	48,5 kHz	PK+	100 kHz	1 s	30 dB
1 GHz - 10 GHz	300 kHz	PK+ ; AVG	1 MHz	1 s	0 dB
