Test Procedures

KDB 789033 – Section C.1
ANSI C63.10-2013 - Section 6.9.3
RSS-GEN Issue 5 – Section 6.7

The occupied bandwidth is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5% of the total mean power of the given emission.

Use the 99% power bandwidth function of the instrument and report the measured bandwidth.

4.5 Frequency Stability

Test Procedures

The EUT was placed inside of an environmental chamber as the temperature in the chamber was varied between 0 °C and +60 °C (Declaration by the Manufacturer). The temperature was incremented by 10 °C (5 °C) intervals and the unit was allowed to stabilize at each temperature before each measurement. The center frequency of the transmitting channel was evaluated at each temperature and the frequency deviation from the channel's center frequency was recorded.

Data for the worst case channel is shown below.

Temperature (°C)	0	10	20	30	40	50	60
Frequency	Measured Frequency Error (kHz)						
5 155.35 MHz	42.710	42.310	32.129	26.401	23.254	17.962	20.893
5 201.35 MHz	43.501	41.610	34.848	26.910	25.764	16.360	24.732
5 247.35 MHz	38.908	42.298	32.376	29.403	19.959	15.054	17.897
5 728.35 MHz	48.055	47.668	37.827	33.220	25.255	20.857	26.155
5 776.35 MHz	32.010	35.867	31.950	30.204	22.090	20.040	28.233
5 824.35 MHz	-76.027	7.611	15.170	21.933	18.938	12.393	25.969

Note :

Based on the results of the frequency stability test shown above the frequency deviation results measured are very small. As such it is determined that the channels at the band edge would remain in-band when the maximum measured frequency deviation noted during the frequency stability tests is applied. Therefore the device is determined to remain operating in band over the temperature range as tested.

The emissions levels at both horizontal and vertical polarizations should be tested.

2. Result = Reading + c.f(Correction factor)
3. Correction factor = Antenna factor + Cable loss + 6 dB attenuator - Amp Gain
4. We have done all test mode. The results are only attached worst cases.

4.7 AC Conducted Emissions

Test Location

Shielded Room

Frequency Range of Measurement

150 kHz to 30 MHz

Instrument Settings

IF Band Width: 9 kHz

Test Procedures

The EUT was placed on a non-metallic table 0.8m above the metallic, grounded floor and 0.4m from the reference ground plane wall. The distance to other metallic surfaces was at least 0.8m.

Amplitude measurements were performed with a quasi-peak detector and an average detector.

0.15 ~ 0.5	66 to 56*	56 to 46*
0.5 ~ 5	56	46
5 ~ 30	60	50
