TEST REPORT

Test Report No.: UL-RPT-RP-15782998-116

Customer : RFbeam Microwave GmbH
Model No. / PMN : V-LD1
HVIN : V-LD1
FCC ID : 2ASYV-V-LD1
ISED Certification No. : IC: 24358-VLD1
Technology : 60 GHz Radar
Test Standard(s) : **FCC Parts 15.207, 15.209, 15.215 & 15.255**
ISED Canada RSS-210 Issue 11, June 2024, Annex J & RSS-Gen Issue 5, February 2021

For details of applied tests refer to test result summary

1. This test report shall not be reproduced in full or partial, without the written approval of UL International Germany GmbH.
2. The results in this report apply only to the sample tested.
3. The test results in this report are traceable to the national or international standards.
4. **Test Report Version 1.1 supersede Version 1.0 with immediate effect**
Test Report No. UL-RPT-RP-15782998-116-FCC Version 1.1, Issue Date 18 JULY 2025 replaces
Test Report No. UL-RPT-RP-15782998-116-FCC Version 1.0, Issue Date 18 JUNE 2025, which is no longer valid.
5. Result of the tested sample: **Pass**
6. All information marked with a (*) were provided by customer / applicant or authorized representative

Prepared by: Yixiang Lin
Title: Project Engineer
Date: 18 July 2025

Approved by: Muhammad Faiq Khan
Title: Project Engineer
Date: 18 July 2025

This laboratory is accredited by DAkkS.
The tests reported herein have been performed in accordance with its' terms of accreditation.

1 Attestation of Test Results

1.1 Description of EUT

The equipment under test (EUT) was a distance measurement sensor operating at 60GHz band.

1.2 General Information

Specification Reference:	47CFR15.255
Specification Title:	Code of Federal Regulations Volume 47 (Telecommunications): Part 15 Subpart C (Intentional Radiators) – Section 15.255
Specification Reference:	47CFR15.207 and 47CFR15.209
Specification Title:	Code of Federal Regulations Volume 47 (Telecommunications): Part 15 Subpart C (Intentional Radiators) – Sections 15.207 and 15.209
Specification Reference:	RSS-Gen Issue 5 February 2021
Specification Title:	General Requirements for Compliance of Radio Apparatus
Specification Reference:	RSS-210 Issue 11 June 2024
Specification Title:	License-Exempt Radio Apparatus: Category I Equipment
Site Registration:	FCC: 399704, ISEDC: 22511
FCC Lab. Designation No.:	DE0019
ISEDC CABID:	DE0008
Location of Testing:	Hedelfinger Strasse. 61,70327 Stuttgart, GERMANY
Test Dates:	8 May 2025 to 18 June 2025

Key to Results  = Complied  = Did not comply			
Decision rule: Where not otherwise specified or communicated in writing, statements of conformity (e.g. Pass/Fail) are established according to the following decision rule: considering the ILAC G8:2019 chapter 4.2.1 (simple acceptance rule). This leads to a maximum 50% of false accept or false reject when the measured value equals the tolerance limit. See ILAC-G8:09/2019 for further details.			

Note(s):

1.4 Deviations from the Test Specification

For the measurements contained within this test report, there were no deviations from, additions to, or exclusions from the test specification identified above.

2 Summary of Testing

2.1 Facilities and Accreditation

The test site and measurement facilities used to collect data are located at Hedelfinger Strasse. 61,70327 Stuttgart, GERMANY. The following table identifies which facilities were utilised for radiated emission measurements documented in this report. Specific facilities are also identified in the test results sections.

SR1	X
SR9	X
SR4/5	X
SR7/8	X

UL International Germany GmbH is accredited by the DAkkS. DAkkS is one of the signatories to the International Laboratory Accreditation Co-operation (ILAC) Arrangement for the mutual recognition of test reports. The tests reported herein have been performed in accordance with its terms of accreditation.

2.3 Calibration and Uncertainty

Measuring Instrument Calibration

In accordance with DAkkS requirements all the measurement equipment is on a calibration schedule. All equipment was within the calibration period on the date of testing.

Measurement Uncertainty

Overview

No measurement or test can ever be perfect, and the imperfections give rise to error of measurement in the results. Consequently, the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

Measurement Uncertainty

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor such that a confidence level of approximately 95% is maintained. For the purposes of this document “approximately” is interpreted as meaning “effectively” or “for most practical purposes”.

Measurement Type	Confidence Level (%)	Calculated Uncertainty
Operating Bandwidth	95%	±0.87 %
Radiated Peak EIRP	95%	±4.98 dB
Transmitter Duty Cycle	95%	±3.4%
Radiated Spurious Emissions below 40 GHz	95%	±3.10 dB
Radiated Spurious Emissions above 40 GHz	95%	±4.98 dB

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty the published guidance of the appropriate accreditation body is followed.

3 Equipment Under Test (EUT)

3.1 Identification of Equipment Under Test (EUT)

Brand Name:	RFbeam
Model Name or Number / HVIN:	V-LD1
PMN:	V-LD1
Test Sample Serial Number:	L2333n00830 (normal sample), L2333n00829 (DC input sample)
Hardware Version:	B
Software Version:	-
HVIN:	V-LD1
FVIN:	-
FCC ID:	2ASYV-V-LD1
ISED Canada Certification Number:	IC: 24358-VLD1
Date of Receipt:	25 April 2025

3.2 Modifications Incorporated in the EUT

No modifications were applied to the EUT during testing.

3.3 Additional Information Related to Testing

Category of Equipment	Transceiver	
Modulation Type:	FMCW	
Power Supply Requirement:	5VDC USB, Nominal 1.8VDC to transceiver	
Antenna Type:	Microstrip	
Transmit Frequency Range	57.4 GHz to 61.4 GHz	
Transmit Channels Tested:	Channel ID	Frequency (GHz)
	Single	59.3

Note: Preliminary measurements were performed with two different range settings (20m and 50m). The 20m range setting turned out to be the worst-case scenario. Final testing was performed with the 20m.

3.4 Description of Test Setup

Support Equipment

The following support equipment were used to exercise the EUT during testing:

A. Support Equipment (In-house)

Item	Description	Brand Name	Model Name or Number	Serial Number
1	Power Supply	Good Will Instrument Co., LTD.	-	7662217
2	Laptop	Lenovo	20NYS1GL1U	PC1D101H

B. Support Equipment (Manufacturer supplied) *

Item	Description	Brand Name	Model Name or Number	Serial Number
1	Control Cable	RFbeam	-	-

Operating Modes

The EUT was tested in the following operating mode(s):

☒ Continuous Transmit mode: FMCW modulation | Single channel | MAX PWR |

- Below parameters were used during the test:

TX Power Setting = 31

Chirp Integration = 100

Range Setting = 20m

Lens Gain = 12dBi

Configuration and Peripherals

The EUT was tested in the following configuration(s):

EUT Power Supply:

- The EUT was powered by USB 5V DC. For frequency stability test, a dedicated test port of 1.8 V DC to the RF circuit of radar was provided by the customer to enable adjustment of input voltage. The 1.8V DC was provided by an external AC/DC power supply.

Test Mode Activation:

- The test mode was by enabled by the test software via the USB cable provided by the customer.

Radiated Measurements:

- The EUT RF sample with antenna was used for radiated spurious emissions measurements.
- The EUT has a lens cover which will enhance the directivity of the radar signal emission, the Transmitter Peak EIRP was performed under condition with and without the lens cover. The configuration with lens cover was found to have highest emission, thus other test items were performed with lens cover.
- Radiated measurements between 30 MHz to 1 GHz were performed with the EUT positioned on the turn table at a height of 0.8m and rotating 360° while the antenna height varies from 1 to 4 m over the measurement frequency range.
- Radiated measurements between 1GHz to 18 GHz were performed with the EUT positioned on the turn table at a height of 1.5m and rotating 360° while the antenna height varies from 1 to 4 m over the measurement frequency range.
- Radiated measurements above 18 GHz were performed with the EUT positioned on the turn table at a height of 1.5m and rotating 360° the antenna height was also fixed to 1.5m over the measurement frequency range.
- R&S® EMC32 V11.30.00 Software was used for the Radiated spurious emission measurements till 40 GHz.

Test Setup Diagrams**Radiated Tests:****Test Setup for Transmitter Radiated Emissions**

Test Setup Diagrams (continued)**Test Setup for Transmitter AC Conducted Spurious Emissions**

4 Test Results

4.1 Transmitter Duty Cycle

Test Summary:

Test Engineer:	Yixiang Lin	Test Date:	18 June 2025
Test Sample Serial Number:	L2333n00830		

FCC Reference:	Part 15.255(c)(2)(ii)
ISED Reference:	RSS-Gen 8.2
Test Method Used:	ANSI C63.10 Section 7.5 and notes below

Environmental Conditions:

Temperature (°C):	22.0
Relative Humidity (%):	42.5

Note(s):

1. Transmitter duty cycle was measured using a spectrum analyzer. The raw data was captured and analysed to calculate the duty cycle:
2. Transmitter off times exceeding 2 ms were summed over a rolling 33 ms period. The minimum combined off time in any 33 ms period was recorded below.

Results:

Pulse Period (T_{ON} + T_{OFF})	Minimum Tx Off Duration (ms)	Tx Off Limit (ms)	Result
(ms)	ms	ms	
33	22.79	>16.5	Complied

Trasnmmitter Duty cycle (continued)

Tx off time 2.2791ms, 10 counts within 33ms

PlotTx on time 862.69 μ s**Plot**

4.2 Transmitter Peak EIRP

Test Summary:

Test Engineer:	Yixiang Lin	Test Date:	16 May 2025
Test Sample Serial Number:	L2333n00830		

FCC Reference:	Part 15.255(c)(2)(ii)
ISED Canada Reference:	RSS-210 J.3.2b(ii)
Test Method Used:	FCC KDB 364244 Section 6 referencing ANSI C63.10 Section 9.10

Environmental Conditions:

Temperature (°C):	22.0
Relative Humidity (%):	42.3

Note(s):

- All measurements were taken at 1 meter distance from EUT, correction factors of the mixers and cables were loaded to the signal analyser prior to testing. Free space loss were used to compensate the measurement distance. $[FSL] = 10 \log (4\pi r/\lambda)^2$.
- According to FCC Part 15.35(b), the use of a pulse desensitization correction factor may be needed to determine the total peak emission level. The instruction manual or application note for the measurement instrument should be consulted for determining pulse desensitization factors, as necessary.

The desensitization correction factor was applied to the Fundamental Emission results.

The derivation of the Pulse Desensitization Factor is given in the Keysight Technologies Application Note 5952-1039.

Desensitization factor was calculated from follow equation.

$$PDF = 20 \log(\alpha)$$

$$\alpha = \frac{1}{\sqrt[4]{1 + \left(\frac{2 \ln(2)}{\pi}\right)^2 \left(\frac{BW_{Chirp}}{T_{Chirp} B^2}\right)^2}}$$

Where

α is the reduction in amplitude

BW_{Chirp} is the FMCW Chirp Bandwidth, which is 3840MHz according to manufacturer

T_{Chirp} is the FMCW Chirp Time, which is 862.69 μ s

B is the 3 dB IF Bandwidth = RBW, 1MHz was used during test

PDF = -3.43 dB

Transmitter Peak EIRP (continued)**Results:**

Peak frequency (GHz)	Measured Value (dBm)	Free space loss (dB)	Receiving Antenna Gain (dBi)	Cable loss (dB)	Pulse Desensitization Factor (dB)	Substituted EIRP Level (dBm)	Limit (dBm)	Margin (dB)	Notes
59.300	-32.19	67.909	25	1.294	-3.43	15.44	20	4.56	With lens peak
59.300	-43.94	67.909	25	1.294	-3.43	3.69	20	16.31	Without lens peak

RF output power = Measured Value + Free space loss + Cable loss + - Receiving Antenna Gain - PDF

Plot: Peak power with lens

Plot: Peak power without lens

4.3 Transmitter 20 dB Bandwidth

Test Summary:

Test Engineer:	Yixiang Lin	Test Date:	8 May 2025
Test Sample Serial Number:	L2333n00830		

FCC Reference:	Part 15.215(c)
ISED Canada Reference:	N/A
Test Method Used:	FCC KDB 364244 Section 5 referencing ANSI C63.10 Section 9.3

Environmental Conditions:

Temperature (°C):	21.0
Relative Humidity (%):	41.5

Note(s):

1. The signal analyser resolution bandwidth was set to 1 MHz and video bandwidth of 3 MHz. A peak detector was used, sweep time was set to auto and trace mode was Max Hold. The span was set to 3 GHz. The 20dB bandwidth was measured at 20 dB down from the peak of the signal.

Transmitter 20 dB Bandwidth (continued)

Results:

Channel	RBW (MHz)	VBW (MHz)	20dB Bandwidth (MHz)
Single	1	3	3888

4.4 Transmitter 99% Emission Bandwidth

Test Summary:

Test Engineer:	Yixiang Lin	Test Date:	8 May 2025
Test Sample Serial Number:	L2333n00830		

FCC Reference:	N/A
ISED Canada Reference:	RSS-Gen 6.7
Test Method Used:	FCC KDB 364244 Section 5 referencing ANSI C63.10 Section 9.3

Environmental Conditions:

Temperature (°C):	21.0
Relative Humidity (%):	41.5

Note(s):

1. The signal analyser resolution bandwidth was set to 1 MHz and video bandwidth 3MHz. A Peak detector was used, sweep time was set to auto and the trace mode was Max Hold. The span was set to 3GHz. The analyzer occupied bandwidth function was used to measure the 99% emission bandwidth.

Transmitter 99% Emission Bandwidth (continued)

Results:

Channel	RBW (MHz)	VBW (MHz)	99% Occupied Bandwidth (MHz)
Single	1	3	3786

4.5 Transmitter Radiated Spurious Emissions

Test Summary:

Test Engineer:	Yixiang Lin	Test Date:	9 May 2025
Test Sample Serial Number:	L2333n00830		

FCC Reference:	Parts 15.255(d) & 15.209
ISED Canada Reference:	RSS-Gen 6.13 & 8.9 / RSS-210 J.4
Test Method Used:	ANSI C63.10 Sections 6.3, 6.4 and 6.5
Frequency Range	9 kHz to 1000 MHz

Environmental Conditions:

Temperature (°C):	21.7
Relative Humidity (%):	31.4

Note(s):

1. The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
2. The preliminary scans showed similar emission levels below 1 GHz, for each channel of operation. Therefore, final radiated emissions measurements were performed with the EUT set to the middle channel only.
3. All other emissions shown on the pre-scans were investigated and found to be ambient, or > 20 dB below the appropriate limit or below the noise floor of the measurement system.
4. Measurements below 30 MHz were performed in a semi-anechoic chamber (Asset Number 1603665) at 3 metres. The EUT was placed at a height of 80 cm above the reference ground plane in the centre of the chamber turntable. ANSI C63.10 clause 5.2 states an alternative test site that can demonstrate equivalence to an open area test site may be used for measurements below 30 MHz. Therefore, measurements were performed in a semi-anechoic chamber. The correlation data between semi-anechoic chamber and an open field test site is available upon request.
5. FCC rule part 15.209(a) specifies limits at 300 m / 30 m in $\mu\text{V/m}$ but RSS GEN specifies limits at 300 m / 30 m in $\mu\text{A/m}$. The relevant limits are the same after accounting for E-field to H-field correction. The limits in CFR 47, Part 15, Subpart C, paragraph 15.209 (a), are identical to those in RSS-GEN Section 8.9, Table 6, the measurements are performed in terms of magnetic field strength and converted to electric field strength levels (as reported in the table). According to Notice 2020-DRS0023 converting the magnetic field strength into electrical field strength using the following equation while considering free space impedance of 377Ω results in a factor of 51.5 dB Ω .

$$AF^E [\text{dB}(\text{m}^{-1})] = AF^H [\text{dB}(\Omega^{-1}\text{m}^{-1})] + Z_0[\text{dB}\Omega]$$

For example, the measurement frequency X KHz resulted in a level of Y dB $\mu\text{V/m}$, which is equivalent to $Y - 51.5 = Z$ dB $\mu\text{A/m}$, which has the same margin, W dB, to the corresponding RSS-GEN Section 8.9, Table 6 limit as it has to the 15.209(a) limit.

Transmitter Radiated Emissions (continued)**Note(s):**

6. The limits are specified at a test distances of 30 and 300 metres. However, as specified in FCC Section 15.31 (f)(2) & ANSI C63.10 clause 6.4.3, measurements may be performed at a closer distance and the measured level extrapolated to the specified measurement distance using the method described in clauses 6.4.4, specifically sub-clause 6.4.4.1 which specifies that the measured level shall be extrapolated to the specified distance by conservatively presuming that the field strength decays at 40 dB/decade.
Therefore, measurements were performed at a measurement distance of 3 m.
7. The measured values at 3 m were extrapolated to the required measurement distances of 300 m and 30 m and compared the specified limits at those distances as follows:
 - 9 kHz- 490 kHz: measured value extrapolated from 3 m to 300 m by subtracting 80 dB at 40 dB /decade.
 - 490 kHz-30 MHz: measured value extrapolated from 3 m to 30 m by subtracting 40 dB at 40 dB /decade.
8. Measurements from 30 MHz to 1 GHz were performed in a semi-anechoic chamber (Asset Number 1603665) at a distance of 3 metres. The EUT was placed at a height of 80 cm above the reference ground plane in the centre of the chamber turntable. Maximum emission levels were determined by height searching the measurement antenna over the range 1 metre to 4 metres.
9. Pre-scans were performed and markers placed on the highest measured levels. The test receiver was configured as follows: For 9 kHz to 150 kHz, the resolution bandwidth was set to 300 Hz and video bandwidth 1 kHz. A peak detector was used and trace mode was Max Hold. For 150 kHz to 30 MHz, the resolution bandwidth was set to 10 kHz and video bandwidth 30 kHz, trace mode was Max Hold. For 30 MHz to 1 GHz, the resolution bandwidth was set to 120 kHz and video bandwidth 500 kHz. A peak detector was used, sweep time was set to auto and trace mode was Max Hold.
10. Final measurements were performed on the marker frequencies and the results entered into the table below. The test receiver resolution bandwidth was set to 120 kHz, using a CISPR quasi-peak detector and span wide enough to see the whole emission.

Transmitter Radiated Emissions (continued)

Results:

9kHz to 30MHz

Frequency (MHz)	Antenna Polarity	Level@3m (dBµV/m)	Level extrapolated (dBµV/m)	Limit (dBµV/m)	Margin (dB)	Result
No critical emissions were detected						

30MHz to 1 GHz

Frequency (MHz)	Antenna Polarity	Level (dBµV/m)	Limit (dBµV/m)	Margin (dB)	Result
No critical emissions were detected					

Full Spectrum

Transmitter Radiated Emissions (continued)

Note: These plots are pre-scans and for indication purposes only. For final measurements, see accompanying table.

4.6 Transmitter Radiated Emissions >1 GHz

Test Summary:

Test Engineer:	Yixiang Lin	Test Date:	9 May 2025
Test Sample Serial Number:	L2333n00830		

FCC Reference:	Parts 15.255(d) & 15.209
ISED Canada Reference:	RSS-Gen 6.13 & 8.9 / RSS-210 J.4
Test Method Used:	FCC KDB 364244 Sections 7 referencing ANSI C63.10 Sections 9.12 & 9.13
Frequency Range	1 GHz to 200 GHz

Environmental Conditions:

Temperature (°C):	21.7
Relative Humidity (%):	31.4

Note(s):

- The final measured value, for the given emission, in the table below incorporates the calibrated antenna factor and cable loss.
- No spurious emissions were detected above the noise floor of the measuring receiver therefore the highest peak and average noise floor readings of the measuring receiver were recorded as shown in the tables below.
- All other emissions shown on the pre-scans were investigated and found to be ambient, or > 20 dB below the appropriate limit or below the noise floor of the measurement system.
- The emission shown at approximately 62GHz is the EUT fundamental.
- Measurements 1 GHz to 18GHz were performed in a semi-anechoic chamber (Asset Number 1603665) at a distance of 3 metres. The EUT was placed at a height of 1.5 metres above the test chamber floor in the centre of the chamber turntable. The antenna height varies from 1 to 4 m over the measurement frequency range.
- Measurements 18 GHz to 40GHz were performed in a semi-anechoic chamber (Asset Number 1603665) at a distance of 1 metres. The EUT was placed at a height of 1.5 m above the reference ground plane in the centre of the chamber turntable.
- Part 15.255(d)(3) defines a power density limit of 90 pW/cm² at 3 meters for spurious emissions between 40 GHz and 200 GHz. This was converted to a field strength limit of 85.31 dBuV/m using equation provided in the section 9.6 of ANSI C63.10.
- Measurement distance above 40 GHz were determined using the procedure defined in section 9.8 of ANSI C63.10. Measurements were made at the following distances:
40GHz to 200 GHz 1 meter
- *In accordance with ANSI C63.10 Section 6.6.4.3 Note 1, if the maximized peak measured value complies with the average limit, then it is unnecessary to perform an average measurement.

Transmitter Radiated Emissions (continued)**Note(s):**

Calculation of the boundary near/far field:

Rayleigh far field distance calculation using formula $R = 2D^2/\lambda$, where D is the dimension of the antenna used during test, λ is the free space wave length in m at the frequency of measurement.

Antenna Range (GHz)	D (m)	Highest frequency (GHz)	Wavelength λ (m)	Near/far field boundary
40-60	0.050	60	0.00499654	1.00
60-90	0.031	90	0.00333103	0.58
90-110	0.028	110	0.00272539	0.58
110-140	0.007	140	0.00214137	0.05
140-220	0.0207	220	0.00136269	0.63

10. Where measurements were performed at a distance other than that specified by the limit, a correction factor was calculated using the equation provided in section 9.4 of ANSI C63.10.

Results:

Peak frequency (GHz)	Measured Value (dBm)	Free space loss (dB)	Receiving Antenna Gain (dBi)	Cable loss (dB)	Duty Cycle Correction Factor (dB)	Substituted EIRP Level (dBm)	Power Flux Density $\mu\text{W}/\text{cm}^2$	Limit ($\mu\text{W}/\text{cm}^2$)	Limit Margin ($\mu\text{W}/\text{cm}^2$)
89.353	-72.42	71.470	25	1.294	0.00	-24.66	3.03	90	86.97
144.000	-69.37	75.615	25	1.294	0.00	-17.46	15.87	90	74.13

4.7 Transmitter Frequency Stability (Temperature Variation)**Test Summary:**

Test Engineer:	Yixiang Lin	Test Date:	16 May 2025
Test Sample Serial Number:	L2333n00830		

FCC Reference:	Part 15.255(f)
ISED Canada Reference:	RSS-Gen 6.11 / RSS-210 J.6
Test Method Used:	FCC KDB 364244 Sections 8 referencing ANSI C63.10 Section 9.14

Environmental Conditions:

Temperature (°C):	22.3
Relative Humidity (%):	42.0

Note(s):

1. The 20 dB emission bandwidth and 99% occupied bandwidth was recorded on a signal analyser and compared to the lower and upper emission edges.
2. Temperature was monitored throughout the test with a calibrated digital thermometer.

Transmitter Frequency Stability (Temperature Variation)**Results: Lower Band Edge**

Temperature (°C)	Lower Band Edge Frequency (MHz)	Lower 20 dB Emission Bandwidth Frequency (MHz)	Lower 99% Occupied Bandwidth Frequency (MHz)	Result
-20	57000	57338	57416	Complied
-10	57000	57339	57416	Complied
0	57000	57338	57416	Complied
10	57000	57338	57416	Complied
20	57000	57338	57421	Complied
30	57000	57339	57416	Complied
40	57000	57338	57416	Complied
50	57000	57338	57416	Complied
Worst-case Margin (MHz)		338		

Results: Upper Band Edge

Temperature (°C)	Upper Band Edge Frequency (MHz)	Upper 20 dB Emission Bandwidth Frequency (MHz)	Upper 99% Occupied Bandwidth Frequency (MHz)	Result
-20	61560	61227	61197	Complied
-10	61560	61227	61197	Complied
0	61560	61227	61197	Complied
10	61560	61227	61198	Complied
20	61560	61230	61198	Complied
30	61560	61227	61198	Complied
40	61560	61230	61198	Complied
50	61560	61230	61198	Complied
Worst-case Margin (MHz)		330		

4.8 Transmitter Frequency Stability (Voltage Variation)

Test Summary:

Test Engineer:	Yixiang Lin	Test Date:	16 May 2025
Test Sample Serial Number:	L2333n00829		

FCC Reference:	Part 15.255(f)
ISED Canada Reference:	RSS-Gen 6.11 / RSS-210 J.6
Test Method Used:	FCC KDB 364244 Sections 8 referencing ANSI C63.10 Section 9.14

Environmental Conditions:

Temperature (°C):	22.3
Relative Humidity (%):	42.0

Note(s):

1. The 20 dB emission bandwidth and 99% occupied bandwidth was recorded on a signal analyser and compared to the lower and upper emission edges.
2. The DC power supply voltage was set to 85% and 115% of the stated Control Unit input voltage of 1.8 VDC.
3. Voltage was monitored throughout the test with a calibrated digital voltmeter.

Transmitter Frequency Stability (Voltage Variation)**Results: Lower Band Edge**

Supply Voltage (V)	Lower Band Edge Frequency (MHz)	Lower 20 dB Emission Bandwidth Frequency (MHz)	Lower 99% Occupied Bandwidth Frequency (MHz)	Result
1.53	57000	57337	57415	Complied
1.80	57000	57338	57421	Complied
2.07	57000	57337	57415	Complied
Worst-case Margin (MHz)		337		

Results: Upper Band Edge

Supply Voltage (V)	Upper Band Edge Frequency (MHz)	Upper 20 dB Emission Bandwidth Frequency (MHz)	Upper 99% Occupied Bandwidth Frequency (MHz)	Result
1.53	61560	61227	61191	Complied
1.80	61560	61230	61198	Complied
2.07	61560	61227	61191	Complied
Worst-case Margin (MHz)		330		

4.9 Transmitter AC Conducted Spurious Emissions

Test Summary:

Test Engineer:	Yixiang Lin	Test Date:	11 June 2025
Test Sample Serial Number:	L2333n00830		

FCC Reference:	Part 15.207
ISED Canada Reference:	RSS-Gen 8.8
Test Method Used:	ANSI C63.10 Section 6.2 / FCC KDB 174176 and notes below

Environmental Conditions:

Temperature (°C):	22.3
Relative Humidity (%):	42.0

Note(s):

1. The EUT was powered by a USB cable which was connected to a laptop. The AC/DC charger of the laptop was connected to single phase supply via a LISN.
2. In accordance with FCC KDB 174176 Q4, tests were performed also with a 240 VAC 60 Hz single phase supply as this was within the voltage range marked on the power supply.
3. A pulse limiter was fitted between the LISN and the test receiver.
4. Pre-scans were performed and markers placed on the highest live and neutral measured levels. Final measurements were performed on the marker frequencies and the results entered into the tables below.
5. Preliminary measurements were performed at both 50 Hz and 60 Hz supply frequencies. There was no change to the observed emissions.

Transmitter AC Conducted Spurious Emissions (continued)**Results: Live / Quasi Peak / 120 VAC 60 Hz**

Frequency (MHz)	Line	Level (dB μ V)	Limit (dB μ V)	Margin (dB)	Result
0.164	Live	31.60	65.30	33.70	Complied
0.436	Live	23.80	57.10	33.30	Complied
8.475	Live	19.10	60.00	40.90	Complied
