Accreditation	The testing laboratory is accredited by Deutsche Akkreditierungsstelle GmbH (DAkKS) in compliance with DIN EN ISO/IEC 17025:2018. Scope of testing and registration number: - Electromagnetic Compatibility and Telecommunication (FCC requirements) D-PL-21375-01-03 - Telekommunikation (TK) D-PL-21375-01-05 Website DAkKS: https://www.dakks.de/ The Deutsche Akkreditierungsstelle GmbH (DAkKS) is also a signatory to the ILAC Mutual Recognition Arrangement
Date of receipt of test samples	2021-03-15
Start – End of tests	2021-03-15 – 2021-03-31

2.2 Possible verdicts of the results

Test sample meets the requirements	P (PASS) – the measured value is below the acceptance limit, AL = TL
Test sample does not meet the requirements	F (FAIL) – the measured value is above the acceptance limit, AL = TL
Test case does not apply to the test sample	N/A (Not applicable)
Test case not performed	N/P (Not performed)

2.3 Observations

No additional observations other than the reported observations within this test report have been made.

2.4 Opinions and Interpretations

No appropriate opinions or interpretations according ISO/IEC 17025:2017 clause 7.8.7 are within this test report.

2.7 Formula for determination of correction values (E_c)

$$E_c = E_R + AF + C_L + D_F - G_A \quad (1)$$

$$M = L_T - E_c \quad (2)$$

E_c = Electrical field – corrected value

E_R = Receiver reading

M = Margin

L_T = Limit

AF = Antenna factor

C_L = Cable loss

D_F = Distance correction factor (if used)

G_A = Gain of pre-amplifier (if used)

All units are dB-units, positive margin means value is below limit.

2.8 Software/Firmware used for measurements

All measurements were done directly with spectrum analyzer.

In some measurements (please see test equipment list for each test) R&S ESW 26 was used (please see chapter 8).

(Instrument) Firmware Version: **1.70**

In some measurements (please see test equipment list for each test) R&S FSW 50 was used (please see chapter 8).

(Instrument) Firmware Version: **4.61**

5 EQUIPMENT UNDER TEST (EUT)

5.1 Product Description*

Anchor is a reference device with a known position. Set of Anchors creates location infrastructure where Tags are being located with sub-meter accuracy. The primary goal of the device is to gather radio signals from mobile locators called Tags and forward them to RTLS Studio where the position is being estimated. Anchor is an IP network device equipped with an Ethernet interface for both data backhaul and/or power supply. Anchors are configured and managed via RTLS Studio software. They support variety of holders to simplify the installation in any premises. Anchors are mounted above Tags which ensures maximum coverage and minimizes obstacles blocking its communication line.

7 TEST RESULTS

7.1 Transmission time measurement

Test equipment (Please see Chapter 8 for exact information of test equipment)

Radiated: A3, R2, Amp1

Reference

Please see Chapter 6

Limits

Please see Chapter 6

Test procedure

The measurement is made radiated. According to customers' information the EUT transmits only when it gets the appropriate command from the computer and when the EUT has a connection through LAN with this computer.

The EUT is placed in the FAC.

The measurement is made in time domain by the central frequency of the channel. Measurement duration 90 s. RBW = 50 MHz.

In the first measurement the LAN connection is established during the whole measurement. It is checked, whether the EUT transmits, when LAN cable is plugged in. The transmission take place within all the measurement time.

In the second measurement the LAN cable is unplugged after app. 45 s. App. 1 s later the EUT stops to transmit.

Please see photos of test set-up in Annex 3.

Results:

The EUT transmits only when it gets the appropriate command from the computer and when the EUT has a connection through LAN with this computer.

VERDICT: PASS. For graphical results pls. see annex 1, section 1 of this test report.

7.2 10 dB bandwidth measurement

Test equipment (Please see Chapter 8 for exact information of test equipment)

7.6 Antenna requirement

Reference

Please see Chapter 6

Limits

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section.

Verdict

The EUT connector and the antenna connector is RP-SMA connector. It ensures that no antenna other than that furnished by the responsible party can be used with the EUT. **PASS.**

9 MEASUREMENT UNCERTAINTIES

Test case	Measurement uncertainty*
Power Output radiated	$\leq \pm 6$ dB
Radiated emissions of transmitters	$\leq \pm 6$ dB
Frequency measurements	± 100 kHz
DC and low frequency voltages	± 3 %
Temperature	± 1 °C

The expanded measurement uncertainty corresponds to the measurement results from the standard measurement uncertainty multiplied by the coverage factor $k = 2$. The true value is located in the corresponding interval with a probability of 95 %.
