1. Client information

Name: Fabman GmbH
Address: Haussteinstrasse 4/2
1020 WIEN
AUSTRIA
Name of contact: Roland Stelzer
Telephone: +4313084666
Fax: -/-
E-mail: contact@fabman.io

2. Equipment under test (EUT)

2.1 Identification of the EUT

Equipment: Fabman Bridge V2
Model: FB-V2
Brand name: Fabman
Serial no.: FB-V2-2020-05-0001
Manufacturer: Fabman GmbH
Country of origin: AUSTRIA
Power rating: AC 100V-240V 50/60Hz
Highest frequency generated or used in the device or on which the device operates or tunes (MHz): 2462 MHz
Date Sample Received: 26.05.2020
Tests were performed: 02.07.2020 – 22.07.2020

2.2 Additional information about the EUT:

The "Fabman Bridge V2 - FB-V2" (= equipment under test – EUT can also operate simultaneously as 2.4 GHz Wifi module. The 2.4 GHz part is not documented in this Report.

The EUT contains a modular approved RF module (Wi-Fi & Bluetooth) with the following ID's:
FCC-ID 2AC7Z-ESPWROOM32D.

The Bluetooth function is disabled by firmware.

To duplicate parts of this test report needs the written confirmation of the test laboratory.

The test results relate only to the above mentioned test sample(s).

3. Description of the Equipment under test and test conditions

FCC-ID:	2AV37-FB-V2
IC ID:	-/-
HVIN:	-/-
Power:	AC 100V-240V 50/60Hz
Cables:	AC: 187 cm
Approx. Size (l x w x h):	(11.5 x 10.0 x 5.3) cm
Test conditions:	The "Fabman Bridge V2 – FB-V2" (= equipment under test – EUT) is a RFID reader operating on frequency 13.56 MHz and had been tested in following modes: (1) NFC active, WLAN active (ping), Load switching ON/OFF operation with 120 V~ 60 Hz The tested configuration represents (based on the product specification) with the tested operation modes the worst case.
Additional information:	-/-
Operating temperature range:	0°C to 40°C
Operating frequencies:	13.56 MHz
Number of channels	1
Type of modulation:	ASK
Spurious Emissions: radiated lowest margin to limit	35.74 dBμV/m @ 940.48 MHz
Environmental conditions during tests:	Ambient temperature: 20 °C Relative humidity 40 % Atmospheric pressure 965 mbar
Antenna specification:	Model: Printed PCB Antenna Gain: -/- Type: ☐ External (with accessible antenna socket) ☒ Internal (integrated, PCB antenna)
Test standard:	- e-CFR Title 47 Chapter I Subchapter A Part 15 Subpart C §15.225: Operation within the band 13.110-14.010 MHz

4. Performed measurements and results

The complete list of measurements required in e-CFR Title 47 Chapter I Subchapter A Part 15 Subpart C is given below.

Standard:	Test Method:		Test requirements:			
			applicable:		fulfilled:	
			Yes	No	Yes	No
§ 15.207	ANSI 63.10	AC Mains Conducted Emissions	☒	☐	☒	☐

5. AC Mains conducted emissions

Applied standards

-e-CFR Title 47 Chapter I Subchapter A Part 15 Subpart C, § 15.207 Conducted limits

Test site

Measurements of conducted emission from EUT was made in the shielded chamber (DC - 10GHz) located in the test facility.

Test equipment and test set up

Test equipment used for conducted measurements on Mains as given in clause Test equipment of this report.

Test setup used for conducted measurements on Mains as given in clause Test setups of this report.

Detector function selection and bandwidth

In conducted emissions measurement CISPR quasi-peak- and average-detector were used.

The bandwidth of the detector of instrument is 10 kHz over the frequency range of 150 kHz to 30 MHz.

Frequency range to be scanned

For conducted emission measurements, the spectrum in the range of 150 kHz to 30 MHz was investigated.

Test conditions and configuration of EUT

The EUT was configured and operated with conditions as mentioned under "Test conditions" in clause 3 of this report.

All modes are investigated by operating the EUT in a range of typical modes of operation, with typical cable positions, and with a typical system equipment configuration and arrangement. For each mode of operation and for each ac power current-carrying conductor, cable manipulation are performed within the range of likely configurations. The highest values measured are shown in the table below. The corresponding configuration is shown in the "Photo(s) of test setup".

The EUT was placed on a 80 cm high non metallic table.

Measurements were performed on the AC terminals of the mains plug , on neutral (N)- and live (L1)-wire had been performed.

Requirements

Frequency Range [MHz]	Quasi-Peak Limits [dB μ V]	Average Limits [dB μ V]
0.15 - 0.5	66 to 56 Note 1	56 to 46 Note 1
0.5 - 5.0	56	46
5.0 - 30.0	60	50
Note 1: The level decreases linearly with the logarithm of the frequency		

Measurement

Measurement performed on 22.07.2020

As worst cases the mode No. (1) with NFC active, WLAN active (ping), Load switching ON/OFF operation with 120 V~ 60 Hz was found and documented in this report.

30 f [MHz]

Remarks:

Composition of the measurement value:

$$M_{\text{Value}} = M_{\text{Rec}} + C_{\text{Loss}} + \text{LISN}_{\text{cor}}$$

M_{Value} = Measurement Value

M_{Rec} = Reading value of test receiver

C_{Loss} = Cable loss between Receiver and LISN

LISN_{cor} = LISN correction factor.

Sample calculation:

$$40.8 \text{ dB}\mu\text{V} = 40.1 \text{ dB}\mu\text{V} + 0.3 \text{ dB} + 0.4 \text{ dB}$$

Results

From the measurement data obtained, the tested sample was considered to have **COMPLIED** with the requirements for the **Conducted Emission**.

6. Radiated emission measurements

Test site

Measurement of radiated emissions from EUT was made in the semi-anechoic chamber SAC3 (DC to 40 GHz) located in the test facility.

Test equipment and test set up

Test equipment used for radiated measurements as given in clause Test equipment of this report.
Test setup used for radiated measurements as given in clause Test Setups of this report.

Detector function selection and bandwidth

In radiated emissions measurement, an EMI test receiver with CISPR detectors was used.

Frequency range	Resolution Bandwidth
9KHz – 150kHz (Quasi Peak & Average* Detector)	200Hz
150KHz – 30MHz (Quasi Peak & Average* Detector)	9kHz
30MHz – 1GHz (Quasi Peak Detector)	120kHz
Above 1GHz (Peak & Average Detector)	1MHz

*Average Detector only in specified frequency range.

Antennas

Measurements were made using a calibrated loop antenna in the range 9 kHz – 30 MHz, as well as a calibrated bilog antenna in the range of 30 to 1000 MHz to determine the emission characteristics of the EUT. Measurements were also made for both horizontal and vertical polarization in a SAC .

The horizontal distance between the receiving antenna and the EUT was 3 meters.

In the range of 1 GHz to 26 GHz measurements were made using a calibrated horn antenna to determine the emission characteristics of the EUT. Measurements were also made for both horizontal and vertical polarization in a SAC with floor absorbers. The horizontal distance between the receiving antenna and the EUT was 3 meters.

Frequency range to be scanned

For radiated emissions measurements, the spectrum in the range of 9kHz MHz to 26 GHz was investigated as the highest frequency generated/used in the EUT is 2.462 GHz.

Test conditions and configuration of EUT

The EUT was configured and operated with conditions as mentioned under “Test conditions” in clause 3.

During test the EUT was operated as specified in the technical instruction of the EUT. For frequencies below 1000 MHz the EUT was placed on a 80 cm and for frequencies above 1000 MHz the EUT was placed on a 150 cm high non metallic table placed on the turntable. The EUT was rotated and the antenna height was varied between 1 m to 4 m to find the maximum RF energy generated from EUT. The procedure according to ANSI C63.10:2013 is used and all modes are investigated by operating the EUT in a range of typical modes of operation, with typical cable positions, and with a typical system equipment configuration and arrangement. For each mode of operation, cable manipulation are performed within the range of likely configurations. The highest values measured are shown in the table below.

Remarks Correction factor included antenna factor and cable attenuation.

Measurements

The Measurement was performed on: 02.07.2020

Result 9 kHz – 30 MHz

In the frequency range 9 kHz – 30 MHz the EUT had been scanned in a distance of 3 m and the Limit were corrected to the test distance of 3 m using a factor with 40 dB/decade acc. to § 15.31 (f)(2).

As worst cases the mode No. (1) with NFC active, WLAN active (ping), Load switching ON/OFF operation with 120 V~ 60 Hz was found and documented in this report.

Only the worst case of the X,Y and Z axis measurement is documented in this report.

7.2 Transmitter frequency stability

Applied standards

e-CFR Title 47 Chapter I Subchapter A Part 15 Subpart C, § 15.225 (f)

Limit

(e) The frequency tolerance of the carrier signal shall be maintained within $\pm 0.01\%$ of the operating frequency over a temperature variation of -20 degrees to $+ 50$ degrees C at normal supply voltage, and for a variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 degrees C. For battery operated equipment, the equipment tests shall be performed using a new battery.

Test equipment and test set up

Test equipment used for conducted measurements as given in clause Test equipment of this report.

Test setup used for conducted measurements as given in clause Test setups of this report.

Description

Frequency stability is a measure of frequency drift due to temperature and supply voltage variations, with reference to the frequency measured at an appropriate reference temperature and the rated supply voltage.

Measurement:

The measurement was carried out on: 15.07.2020 according to the temperature conditions of the manual from 0° - 40° .

Results

From the measurement data obtained, the tested sample was considered to have **COMPLIED** with the requirements for the **Transmitter frequency stability**.

8. 20 dB Bandwidth

Applied standards

e-CFR Title 47 Chapter I Subchapter A Part 15 Subpart C, § 15.215 (c)

Limit

(c) Intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§ 15.217 through 15.257 and in subpart E of this part, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated. In the case of intentional radiators operating under the provisions of subpart E, the emission bandwidth may span across multiple contiguous frequency bands identified in that subpart. The requirement to contain the designated bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage. If a frequency stability is not specified in the regulations, it is recommended that the fundamental emission be kept within at least the central 80% of the permitted band in order to minimize the possibility of out-of-band operation.

Test equipment and test set up

Test equipment used for conducted measurements as given in clause Test equipment of this report.

Test setup used for conducted measurements as given in clause Test setups of this report.

Description

The bandwidth is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency. Once the reference level is established, the equipment is conditioned with typical modulating signal to produce the worst-case (i.e. the widest) bandwidth.

Measurement:

The Measurement was performed on: 15.07.2020

EUT Frequency (MHz)	20 dB OBW lower (f _L) frequency [MHz]	20 dB OBW upper (f _H) frequency [MHz]	20 dB Bandwidth [kHz]	Limit lower (f _L) frequency [MHz]	Limit upper (f _H) frequency [MHz]	Result	Comment

Results

From the measurement data obtained, the tested sample was considered to have **COMPLIED** with the requirements for the **20 dB Bandwidth**.

9. Band-Edges Measurement / Out of Band Emissions

Applied standards

-e-CFR Title 47 Chapter I Subchapter A Part 15 Subpart C §15.247 (d)

Limit

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 30 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. Emissions which fall in the restricted bands, as defined in §15.205 Restricted Bands of operation and must also comply with the radiated emission limits specified in §15.209 Radiated emission limits.

Test equipment and test set up

Test equipment used for Band Edge measurements as given in clause Test equipment of this report.
Test setup used for Band Edge measurements as given in clause Test setups of this report.

Description

For restricted Bands:

The Emission must comply with the radiated emission limits. Measured with Average and Peak detector.

For non restricted Bands:

The band edge is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency.

The measurements are initially carried out according to the requirements for restricted bands, as these requirements are more stringent. If the limit value is exceeded in a non-restricted band according to the restricted band specifications, the measurement is repeated again with requirements for non restricted bands in order to prove the conformity.

Note: It was not necessary to carry out a re-test for non restricted band requirements for the tested EUT.

Detector function selection and bandwidth

For the measurement, an EMI test receiver that have CISPR peak detector as well as average detector were used.

Band Edge for restricted Band

Frequency range:	Bandwidth	
See measurement graph	RBW:	1 MHz
	VBW:	3 MHz

Band Edge for non restricted Band

Frequency range:	Bandwidth	
See measurement graph	RBW:	100 kHz
	VBW:	300 kHz

All measurements were made with measuring instruments, including any accessories that may affect test results, calibrated according to the requests of ISO/IEC 17025 according to which the test site is accredited from DAkkS. Measurement of conducted mains emissions was made with instruments conforming to American National Standard Specification, ANSI C63.10-2013.

12. Measurement uncertainty

according to CISPR 16-4-2 Edition 2.0 2011-06

Measurement	calculated uncertainty U_{lab}	Specified CISPR uncertainty according CISPR 16-4-2 Edition 2.0 2011-06, table 1 U_{CISPR}
Conducted disturbance at mains port using AMN 9 kHz – 150 kHz	3.6 dB	3.8 dB
Conducted disturbance at mains port using AMN 150 kHz – 30 MHz	3.2 dB	3.4 dB
Magn. fieldstrength 9kHz - 30MHz	3.4 dB	-/-
Radiated disturbance (electric field strength in the SAC) 30 MHz to 1 000 MHz	4.7 dB	6.3 dB
Radiated disturbance (electric field strength in the SAC) 1 GHz to 26.5 GHz	4.1 dB	-/-

Measurement	calculated uncertainty U_{lab}	Maximum measurement uncertainty
Channel Bandwidth	$\pm 1.17 \%$	$\pm 5 \%$
RF output power, conducted	$\pm 1.36 \text{ dB}$	$\pm 1.5 \text{ dB}$
Power Spectral Density, conducted	$\pm 1.99 \text{ dB}$	$\pm 3 \text{ dB}$
Unwanted Emissions, conducted	$\pm 1.71 \text{ dB}$	$\pm 3 \text{ dB}$
All emissions, radiated	$\pm 4.8 \text{ dB}$	$\pm 6 \text{ dB}$
Temperature	$\pm 0.72 \text{ }^{\circ}\text{C}$	$\pm 3 \text{ }^{\circ}\text{C}$
Supply voltages	$\pm 0.76 \%$ (DC up to 40V) $\pm 1.74 \%$ (AC 50Hz up to 400V)	$\pm 3 \%$
Time	$\pm 0.012 \%$	$\pm 5 \%$

The measurement uncertainty describes the overall uncertainty of the given measured value during the operation of the EUT in the above mentioned way.

The measurements uncertainty was calculated in accordance with CISPR 16-4-2 Edition 2.0 2011-06.

The measurement uncertainty was given with a confidence of 95 % ($k = 2$).

13. Photos setup

14. Conclusions

From the measurement data obtained, the tested sample was considered to have **COMPLIED** with the requirements for the relevant §15.225 Operation within the band 13.110 – 14.010 MHz.

Following specific modifications and/or special attributes are necessary to pass the above mentioned requirements:
