Summary and Test Methodology

This test report supports an application for a Class II Permissive Change for a transmitter operating under:

CFR Title 47 FCC Part 15.225, ISED Canada RSS-210 Issue 10 Annex B.6

For details of the modifications to the product, please refer to the Class II Permissive Change Request Letter in the certification application package.

The LumiraDx Instrument is a multi-protocol RFID read/write module for use with most industry standard 13.56MHz RFID tags and smart labels.

All the testing was performed in accordance with ANSI C63.10-2013. During testing, the EUT was positioned on its back in tabletop configuration as seen in the Test Setup Photos exhibit. This position was declared by the client as EUT's only installation and use configuration.

We found that the product met the above requirements without modifications. Test sample was received in good condition.

The environmental conditions during testing are documented on the associated data tables.

Following bandwidths were used during emissions testing:

Freq. (MHz)	RBW	VBW	Pre-scan	Final
0.009-0.15	200Hz	1kHz	Peak	Quasi Peak
0.15-30	9kHz	30kHz	Peak	Quasi Peak
30-1000	120kHz	300kHz	Peak	Quasi Peak
1000-2000	1MHz	3MHz	Peak	Peak Max Hold and RMS Power Avg Max Hold

If peak measurements were below the applicable limit, QPk and RMS measurements were not performed. Testing above 2GHz was not required since client declared the highest clock in the EUT as 200MHz.

Summary of Results

The EUT complied with the following requirements:

RSS-GEN	RSP-100	RSS 210	Part 15	Comments
6.4			15.15(b)	There are no controls accessible to the user that varies the output power.
	3.1		15.19	The label is shown in the label exhibit.
	3.2		15.21	Information to the user is shown in the instruction manual exhibit.
			15.27	No special accessories are required for compliance.
3.2			15.31	The EUT was tested in accordance with the measurement standards in this section.
6.13.2			15.33	Frequency range was investigated according to this section, unless noted in specific rule section under which the equipment operates.
6.13.1			15.35	The EUT emissions were measured using the measurement detector and bandwidth specified in this section, unless noted in specific rule section under which the equipment operates.
6.8			15.203	EUT has an integral loop antenna.
8.10 8.9		7.3	15.205 15.209	Fundamental is not in a restricted band and the spurious and harmonic emissions in the restricted bands comply with the general emission limits of 15.209 or RSS-Gen as applicable.
8.8			15.207	Complies with applicable AC line conducted emission limits.

Modifications Required for Compliance

No modifications were required to achieve compliance.

Testing Notes

RSS-GEN Table 6 H-field limits are 51.5dB lower than FCC 15.209(a) E-field limits. Measurements are performed in terms of magnetic field and converted to electric field using the free space impedance of 377Ω (E-field = H-field + 51.5). Therefore resulting pass/fail margin would be the same if an E-field reading is compared to an E-field limit or an H-field reading is compared to an H-field limit.

Test Results

Fundamental and Emissions Mask

- (a) The field strength of any emissions within the band 13.553-13.567 MHz shall not exceed 15,848 microvolts/meter at 30 meters.
- (b) Within the bands 13.410-13.553 MHz and 13.567-13.710 MHz, the field strength of any emissions shall not exceed 334 microvolts/meter at 30 meters.
- (c) Within the bands 13.110-13.410 MHz and 13.710-14.010 MHz the field strength of any emissions shall not exceed 106 microvolts/meter at 30 meters.

Conversion formulas used:

$$3m \text{ Distance} = (\text{dB}\mu\text{V/m}@30m) + 40\log(30/3)$$

$$\text{Margin} = \text{Reading} - \text{Preamp} + \text{Antenna Factor} + \text{Cable Factor} - \text{Limit}$$

Emission mask defined in 15.225 (a)-(d) was not necessary since the highest 13.56MHz fundamental of 57.3dBμV/m at 3m is below the 15.209 limit of 69.5dBμV/m at 3m. In addition, all radiated spurious emissions were below the 15.209 limits.

Radiated Spurious Emissions

The field strength of any emissions appearing outside of the 13.110-14.010 MHz band shall not exceed the general radiated emission limits in §15.209 and RSS-Gen.

Measurement Uncertainty

The listed uncertainties are the worst-case uncertainty for the entire range of measurement. Please note that the uncertainty values are provided for informational purposes only and are not used in determining the PASS/FAIL results. Values for measurement uncertainty are calculated per ETSI TR 100 028 (2001). This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of $k = 2$.

Measurement	Expanded Uncertainty $k=2$	Maximum allowable uncertainty
Conducted Emissions		
NIST	3.9dB	N/A
CISPR	3.6dB	3.6dB (Ucisp)
Radio frequency (@ 2.4GHz)	3.23×10^{-8}	1×10^{-7}
RF power, conducted	0.40dB	0.75dB
Maximum frequency deviation:		
• Within 300Hz and 6kHz of audio frequency / Within 6kHz and 25kHz of audio frequency	3.4% 0.3dB	5% 3dB
Adjacent channel power	1.9dB	3dB
Conducted spurious emission of transmitter, valid up to 12.75GHz	2.39dB	3dB
Conducted emission of receivers	1.3dB	3dB
Radiated emission of transmitter, valid up to 26.5GHz	3.9dB	6dB
Radiated emission of transmitter, valid up to 80GHz	3.3dB	6dB
Radiated emission of receiver, valid up to 26.5GHz	3.9dB	6dB
Radiated emission of receiver, valid up to 80GHz	3.3dB	6dB
