

ESP32 Technical Reference Manual

Version 3.1

Espressif Systems

About This Manual

The **ESP32 Technical Reference Manual** is addressed to application developers. The manual provides detailed and complete information on how to use the ESP32 memory and peripherals.

For pin definition, electrical characteristics and package information, please see [ESP32 Datasheet](#).

Additional documentation and other resources about ESP32 can be accessed here: [ESP32 Resources](#).

Release Notes

Date	Version	Release notes
2016.08	V1.0	Initial release.
2016.09	V1.1	Added Chapter I2C Controller .
2016.11	V1.2	Added Chapter PID/MPU/MMU ; Updated Section IO_MUX and GPIO Matrix Register Summary ; Updated Section LED_PWM Register Summary .
2016.12	V1.3	Added Chapter eFuse Controller ; Added Chapter RSA Accelerator ; Added Chapter Random Number Generator ; Updated Section I2C Controller Interrupt and Section I2C Controller Registers .
2017.01	V1.4	Added Chapter SPI ; Added Chapter UART Controllers .
2017.03	V1.5	Added Chapter I2S .
2017.03	V1.6	Added Chapter SD/MMC Host Controller ; Added register IO_MUX_PIN_CTRL in Chapter IO_MUX and GPIO Matrix .
2017.05	V1.7	Added Chapter On-Chip Sensors and Analog Signal Processing ; Added Section Audio PLL ; Updated Section eFuse Controller Register Summary ; Updated Sections I2S PDM and LCD MODE ; Updated Section Communication Format Supported by GP-SPI Slave .
2017.06	V1.8	Added register I2S_STATE_REG in Chapter I2S ; Updated Chapter IO_MUX and GPIO Matrix ; Added Chapter ULP Co-processor .
2017.06	V1.9	Updated Chapter IO_MUX and GPIO Matrix ; Added Chapter MCPWM .
2017.07	V2.0	Added Chapter SDIO Slave .
2017.07	V2.1	Updated the addresses of the GPIO configuration/data registers and the GPIO RTC function configuration registers in Chapter IO_MUX and GPIO Matrix ; Added Chapter PID Controller .
2017.07	V2.2	Added Chapter Low-Power Management .
2017.08	V2.3	Added Chapter Flash Encryption/Decryption .

Date	Version	Release notes
2017.09	V2.4	Added the description of register SLC0HOST_TOKEN_RDATA in Chapter SDIO Slave; Added notes in Section The Clock of I2S Module; Added a note in Section GP-SPI Master Mode; Added Chapter DPort Register; Added Chapter DMA Controller.
2017.11	V2.5	Updated the addresses for register SPI_CTRL_REG in Section SPI Register Summary; Added Section Clock Phase Selection in Chapter SD/MMC Host Controller, and a description of register CLK_EDGE_SEL; Major revision on Chapter I2C Controller.
2017.11	V2.6	Updated Chapter Remote Controller Peripheral: • Updated Figure 88 RMT Architecture; • Updated section RMT RAM; • Updated section Transmitter; • Updated the description of RMT_CH_n_TX_THR_EVENT_INT. Added notes in Section UART RAM and Register UART_CONF0_REG.
2017.12	V2.7	Added Subsection Cache in Section System and Memory; Updated Section Timers and the naming of several registers in LED_PWM; Updated the description of console_debug_disable in Chapter eFuse Controller.
2018.01	V2.8	Added Chapter Ethernet MAC. Added the description of system parameter BLK3_part_reserve in Chapter eFuse Controller.
2018.02	V2.9	Updated Sections 4.2.2, 4.2.3, 4.3.2; Added registers I2S_FIFO_WR_REG and I2S_FIFO_RD_REG in Section I2S Registers.
2018.03	V3.0	Updated the instruction layout diagram of ST in Section 29.4.2; Added description of registers EMACADDR2HIGH_REG to EMACADDR7LOW_REG in Section 10.9 and Section 10.10.
2018.04	V3.1	Updated Figure 88 RMT Architecture; Added a note to Section 4.7; Added the function description for the bits of the register in section 4.46.

5.2	Features	84
5.3	Functional Description	84
5.3.1	System and Memory Register	84
5.3.2	Reset and Clock Registers	84
5.3.3	Interrupt Matrix Register	85
5.3.4	DMA Registers	89
5.3.5	PID/MPU/MMU Registers	89
5.3.6	APP_CPU Controller Registers	92
5.3.7	Peripheral Clock Gating and Reset	92
5.4	Register Summary	95
5.5	Registers	101
6	DMA Controller	115

6.1	Overview	115
6.2	Features	115
6.3	Functional Description	115
6.3.1	DMA Engine Architecture	115
6.3.2	Linked List	116
6.4	UART DMA (UDMA)	116
6.5	SPI DMA Interface	117
6.6	I2S DMA Interface	118
7	SPI	120
7.1	Overview	120
7.2	SPI Features	120
7.3	GP-SPI	121
7.3.1	GP-SPI Master Mode	121
7.3.2	GP-SPI Slave Mode	122
7.3.2.1	Communication Format Supported by GP-SPI Slave	122
7.3.2.2	Command Definitions Supported by GP-SPI Slave in Half-duplex Mode	122
7.3.3	GP-SPI Data Buffer	123
7.4	GP-SPI Clock Control	123
7.4.1	GP-SPI Clock Polarity (CPOL) and Clock Phase (CPHA)	124
7.4.2	GP-SPI Timing	124
7.5	Parallel QSPI	125
7.5.1	Communication Format of Parallel QSPI	126
7.6	GP-SPI Interrupt Hardware	126
7.6.1	SPI Interrupts	126
7.6.2	DMA Interrupts	127
7.7	Register Summary	127
7.8	Registers	130
8	SDIO Slave	152
8.1	Overview	152
8.2	Features	152
8.3	Functional Description	152
8.3.1	SDIO Slave Block Diagram	152
8.3.2	Sending and Receiving Data on SDIO Bus	153
8.3.3	Register Access	153
8.3.4	DMA	154
8.3.5	Packet-Sending/-Receiving Procedure	155
8.3.5.1	Sending Packets to SDIO Host	155
8.3.5.2	Receiving Packets from SDIO Host	156
8.3.6	SDIO Bus Timing	157
8.3.7	Interrupt	158
8.3.7.1	Host Interrupt	158
8.3.7.2	Slave Interrupt	158
8.4	Register Summary	159
8.5	SLC Registers	161
8.6	SLC Host Registers	169

8.7	HINF Registers	182
9	SD/MMC Host Controller	183
9.1	Overview	183
9.2	Features	183
9.3	SD/MMC External Interface Signals	183
9.4	Functional Description	184
9.4.1	SD/MMC Host Controller Architecture	184
9.4.1.1	BIU	185
9.4.1.2	CIU	185
9.4.2	Command Path	185
9.4.3	Data Path	186
9.4.3.1	Data Transmit Operation	186
9.4.3.2	Data Receive Operation	187
9.5	Software Restrictions for Proper CIU Operation	187
9.6	RAM for Receiving and Sending Data	188
9.6.1	Transmit RAM Module	188
9.6.2	Receive RAM Module	189
9.7	Descriptor Chain	189
9.8	The Structure of a Linked List	189
9.9	Initialization	191
9.9.1	DMAC Initialization	191
9.9.2	DMAC Transmission Initialization	192
9.9.3	DMAC Reception Initialization	192
9.10	Clock Phase Selection	193
9.11	Interrupt	193
9.12	Register Summary	194
9.13	Registers	195
10	Ethernet MAC	215
10.1	Overview	215
10.2	EMAC_CORE	217
10.2.1	Transmit Operation	217
10.2.1.1	Transmit Flow Control	218
10.2.1.2	Retransmission During a Collision	218
10.2.2	Receive Operation	218
10.2.2.1	Reception Protocol	219
10.2.2.2	Receive Frame Controller	219
10.2.2.3	Receive Flow Control	219
10.2.2.4	Reception of Multiple Frames	220
10.2.2.5	Error Handling	220
10.2.2.6	Receive Status Word	220
10.3	MAC Interrupt Controller	220
10.4	MAC Address Filtering	221
10.4.1	Unicast Destination Address Filtering	221
10.4.2	Multicast Destination Address Filtering	221
10.4.3	Broadcast Address Filtering	221

10.4.4	Unicast Source Address Filtering	221
10.4.5	Inverse Filtering Operation	222
10.4.6	Good Transmitted Frames and Received Frames	223
10.5	EMAC_MTL (MAC Transaction Layer)	224
10.6	PHY Interface	224
10.6.1	MII (Media Independent Interface)	224
10.6.1.1	Interface Signals Between MII and PHY	224
10.6.1.2	MII Clock	225
10.6.2	RMII (Reduced Media-Independent Interface)	226
10.6.2.1	RMII Interface Signal Description	226
10.6.2.2	RMII Clock	227
10.6.3	Station Management Agent (SMA) Interface	227
10.7	Ethernet DMA Features	227
10.8	Linked List Descriptors	228
10.8.1	Transmit Descriptors	228
10.8.2	Receive Descriptors	234
10.9	Register Summary	239
10.10	Registers	241

11 I2C Controller 273

11.1	Overview	273
11.2	Features	273
11.3	Functional Description	273
11.3.1	Introduction	273
11.3.2	Architecture	274
11.3.3	I2C Bus Timing	275
11.3.4	I2C cmd Structure	275
11.3.5	I2C Master Writes to Slave	276
11.3.6	I2C Master Reads from Slave	280
11.3.7	Interrupts	282
11.4	Register Summary	283
11.5	Registers	285

12 I2S 296

12.1	Overview	296
12.2	Features	297
12.3	The Clock of I2S Module	298
12.4	I2S Mode	299
12.4.1	Supported Audio Standards	299
12.4.1.1	Philips Standard	299
12.4.1.2	MSB Alignment Standard	299
12.4.1.3	PCM Standard	300
12.4.2	Module Reset	300
12.4.3	FIFO Operation	300
12.4.4	Sending Data	301
12.4.5	Receiving Data	302
12.4.6	I2S Master/Slave Mode	304

12.4.7 I2S PDM	304
12.5 LCD Mode	306
12.5.1 LCD Master Transmitting Mode	306
12.5.2 Camera Slave Receiving Mode	307
12.5.3 ADC/DAC mode	308
12.6 I2S Interrupts	309
12.6.1 FIFO Interrupts	309
12.6.2 DMA Interrupts	309
12.7 Register Summary	310
12.8 Registers	312

13 UART Controllers 330

13.1 Overview	330
13.2 UART Features	330
13.3 Functional Description	330
13.3.1 Introduction	330
13.3.2 UART Architecture	331
13.3.3 UART RAM	332
13.3.4 Baud Rate Detection	332
13.3.5 UART Data Frame	333
13.3.6 Flow Control	334
13.3.6.1 Hardware Flow Control	334
13.3.6.2 Software Flow Control	335
13.3.7 UART DMA	335
13.3.8 UART Interrupts	335
13.3.9 UCHI Interrupts	336
13.4 Register Summary	336
13.5 Registers	340

14 LED_PWM 367

14.1 Introduction	367
14.2 Functional Description	367
14.2.1 Architecture	367
14.2.2 Timers	368
14.2.3 Channels	368
14.2.4 Interrupts	369
14.3 Register Summary	370
14.4 Registers	373

15 Remote Control Peripheral 383

15.1 Introduction	383
15.2 Functional Description	383
15.2.1 RMT Architecture	383
15.2.2 RMT RAM	384
15.2.3 Clock	384
15.2.4 Transmitter	385
15.2.5 Receiver	385

15.2.6 Interrupts	385
15.3 Register Summary	385
15.4 Registers	387
16 MCPWM	392
16.1 Introduction	392
16.2 Features	392
16.3 Submodules	394
16.3.1 Overview	394
16.3.1.1 Prescaler Submodule	394
16.3.1.2 Timer Submodule	394
16.3.1.3 Operator Submodule	395
16.3.1.4 Fault Detection Submodule	397
16.3.1.5 Capture Submodule	397
16.3.2 PWM Timer Submodule	397
16.3.2.1 Configurations of the PWM Timer Submodule	397
16.3.2.2 PWM Timer's Working Modes and Timing Event Generation	398
16.3.2.3 PWM Timer Shadow Register	402
16.3.2.4 PWM Timer Synchronization and Phase Locking	402
16.3.3 PWM Operator Submodule	402
16.3.3.1 PWM Generator Submodule	403
16.3.3.2 Dead Time Generator Submodule	413
16.3.3.3 PWM Carrier Submodule	417
16.3.3.4 Fault Handler Submodule	419
16.3.4 Capture Submodule	421
16.3.4.1 Introduction	421
16.3.4.2 Capture Timer	421
16.3.4.3 Capture Channel	421
16.4 Register Summary	422
16.5 Registers	424
17 PULSE_CNT	467
17.1 Introduction	467
17.2 Functional Description	467
17.2.1 Architecture	467
17.2.2 Counter Channel Inputs	467
17.2.3 Watchpoints	468
17.2.4 Examples	469
17.2.5 Interrupts	469
17.3 Register Summary	469
17.4 Registers	471
18 64-bit Timers	475
18.1 Introduction	475
18.2 Functional Description	475
18.2.1 16-bit Prescaler	475
18.2.2 64-bit Time-base Counter	475

18.2.3 Alarm Generation	476
18.2.4 MWDT	476
18.2.5 Interrupts	476
18.3 Register Summary	476
18.4 Registers	478

19 Watchdog Timers 485

19.1 Introduction	485
19.2 Features	485
19.3 Functional Description	485
19.3.1 Clock	485
19.3.1.1 Operating Procedure	486
19.3.1.2 Write Protection	486
19.3.1.3 Flash Boot Protection	486
19.3.1.4 Registers	487

20 eFuse Controller 488

20.1 Introduction	488
20.2 Features	488
20.3 Functional Description	488
20.3.1 Structure	488
20.3.1.1 System Parameter efuse_wr_disable	489
20.3.1.2 System Parameter efuse_rd_disable	490
20.3.1.3 System Parameter coding_scheme	490
20.3.1.4 BLK3_part_reserve	491
20.3.2 Programming of System Parameters	491
20.3.3 Software Reading of System Parameters	494
20.3.4 The Use of System Parameters by Hardware Modules	495
20.3.5 Interrupts	496
20.4 Register Summary	496
20.5 Registers	498

21 AES Accelerator 508

21.1 Introduction	508
21.2 Features	508
21.3 Functional Description	508
21.3.1 AES Algorithm Operations	508
21.3.2 Key, Plaintext and Ciphertext	508
21.3.3 Endianness	509
21.3.4 Encryption and Decryption Operations	511
21.3.5 Speed	511
21.4 Register Summary	511
21.5 Registers	513

22 SHA Accelerator 515

22.1 Introduction	515
22.2 Features	515

22.3	Functional Description	515
22.3.1	Padding and Parsing the Message	515
22.3.2	Message Digest	515
22.3.3	Hash Operation	516
22.3.4	Speed	516
22.4	Register Summary	516
22.5	Registers	518
23	RSA Accelerator	523
23.1	Introduction	523
23.2	Features	523
23.3	Functional Description	523
23.3.1	Initialization	523
23.3.2	Large Number Modular Exponentiation	523
23.3.3	Large Number Modular Multiplication	525
23.3.4	Large Number Multiplication	525
23.4	Register Summary	526
23.5	Registers	527
24	Random Number Generator	529
24.1	Introduction	529
24.2	Feature	529
24.3	Functional Description	529
24.4	Register Summary	529
24.5	Register	529
25	Flash Encryption/Decryption	530
25.1	Overview	530
25.2	Features	530
25.3	Functional Description	530
25.3.1	Key Generator	531
25.3.2	Flash Encryption Block	531
25.3.3	Flash Decryption Block	532
25.4	Register Summary	532
25.5	Register	534
26	PID/MPU/MMU	535
26.1	Introduction	535
26.2	Features	535
26.3	Functional Description	535
26.3.1	PID Controller	535
26.3.2	MPU/MMU	536
26.3.2.1	Embedded Memory	536
26.3.2.2	External Memory	542
26.3.2.3	Peripheral	548
27	PID Controller	550

27.1 Overview	550
27.2 Features	550
27.3 Functional Description	550
27.3.1 Interrupt Identification	551
27.3.2 Information Recording	551
27.3.3 Proactive Process Switching	553
27.4 Register Summary	555
27.5 Registers	556

28 On-Chip Sensors and Analog Signal Processing 560

28.1 Introduction	560
28.2 Capacitive Touch Sensor	560
28.2.1 Introduction	560
28.2.2 Features	560
28.2.3 Available GPIOs	561
28.2.4 Functional Description	561
28.2.5 Touch FSM	562
28.3 SAR ADC	563
28.3.1 Introduction	563
28.3.2 Features	564
28.3.3 Outline of Function	564
28.3.4 RTC SAR ADC Controllers	566
28.3.5 DIG SAR ADC Controllers	567
28.4 Low-Noise Amplifier	569
28.4.1 Introduction	569
28.4.2 Features	569
28.4.3 Overview of Function	569
28.5 Hall Sensor	570
28.5.1 Introduction	570
28.5.2 Features	571
28.5.3 Functional Description	571
28.6 Temperature Sensor	571
28.6.1 Introduction	571
28.6.2 Features	572
28.6.3 Functional Description	572
28.7 DAC	572
28.7.1 Introduction	572
28.7.2 Features	572
28.7.3 Structure	573
28.7.4 Cosine Waveform Generator	573
28.7.5 DMA support	574
28.8 Register Summary	575
28.8.1 Sensors	575
28.8.2 Advanced Peripheral Bus	575
28.8.3 RTC I/O	576
28.9 Registers	577
28.9.1 Sensors	577

28.9.2	Advanced Peripheral Bus	588
28.9.3	RTC I/O	591
29	ULP Co-processor	592
29.1	Introduction	592

1. System and Memory

1.1 Introduction

The ESP32 is a dual-core system with two Harvard Architecture Xtensa LX6 CPUs. All embedded memory, external memory and peripherals are located on the data bus and/or the instruction bus of these CPUs.

With some minor exceptions (see below), the address mapping of two CPUs is symmetric, meaning that they use the same addresses to access the same memory. Multiple peripherals in the system can access embedded memory via DMA.

The two CPUs are named “PRO_CPU” and “APP_CPU” (for “protocol” and “application”), however, for most purposes the two CPUs are interchangeable.

1.2 Features

- Address Space
 - Symmetric address mapping
 - 4 GB (32-bit) address space for both data bus and instruction bus
 - 1296 KB embedded memory address space
 - 19704 KB external memory address space
 - 512 KB peripheral address space
 - Some embedded and external memory regions can be accessed by either data bus or instruction bus
 - 328 KB DMA address space
- Embedded Memory
 - 448 KB Internal ROM
 - 520 KB Internal SRAM
 - 8 KB RTC FAST Memory
 - 8 KB RTC SLOW Memory
- External Memory

Off-chip SPI memory can be mapped into the available address space as external memory. Parts of the embedded memory can be used as transparent cache for this external memory.

 - Supports up to 16 MB off-Chip SPI Flash.
 - Supports up to 8 MB off-Chip SPI SRAM.
- Peripherals
 - 41 peripherals
- DMA
 - 13 modules are capable of DMA operation

The block diagram in Figure 1 illustrates the system structure, and the block diagram in Figure 2 illustrates the address map structure.

Figure 1: System Structure

Figure 2: System Address Mapping

1.3 Functional Description

1.3.1 Address Mapping

Each of the two Harvard Architecture Xtensa LX6 CPUs has 4 GB (32-bit) address space. Address spaces are symmetric between the two CPUs.

Addresses below 0x4000_0000 are serviced using the data bus. Addresses in the range 0x4000_0000 ~ 0x4FFF_FFFF are serviced using the instruction bus. Finally, addresses over and including 0x5000_0000 are shared by the data and instruction bus.

The data bus and instruction bus are both little-endian: for example, byte addresses 0x0, 0x1, 0x2, 0x3 access the least significant, second least significant, second most significant, and the most significant bytes of the 32-bit word stored at the 0x0 address, respectively. The CPU can access data bus addresses via aligned or non-aligned byte, half-word and word read-and-write operations. The CPU can read and write data through the instruction bus, but only in a **word aligned manner**; non-word-aligned access will cause a CPU exception.

Each CPU can directly access embedded memory through both the data bus and the instruction bus, external memory which is mapped into the address space (via transparent caching & MMU), and peripherals. Table 2 illustrates address ranges that can be accessed by each CPU's data bus and instruction bus.

Some embedded memories and some external memories can be accessed via the data bus or the instruction bus. In these cases, the same memory is available to either of the CPUs at two address ranges.

Table 2: Address Mapping

Bus Type	Boundary Address		Size	Target
	Low Address	High Address		
	0x0000_0000	0x3F3F_FFFF		Reserved
Data	0x3F40_0000	0x3F7F_FFFF	4 MB	External Memory
Data	0x3F80_0000	0x3FBF_FFFF	4 MB	External Memory
	0x3FC0_0000	0x3FEF_FFFF	3 MB	Reserved
Data	0x3FF0_0000	0x3FF7_FFFF	512 KB	Peripheral
Data	0x3FF8_0000	0x3FFF_FFFF	512 KB	Embedded Memory
Instruction	0x4000_0000	0x400C_1FFF	776 KB	Embedded Memory
Instruction	0x400C_2000	0x40BF_FFFF	11512 KB	External Memory
	0x40C0_0000	0x4FFF_FFFF	244 MB	Reserved
Data Instruction	0x5000_0000	0x5000_1FFF	8 KB	Embedded Memory
	0x5000_2000	0xFFFF_FFFF		Reserved

1.3.2 Embedded Memory

The Embedded Memory consists of four segments: internal ROM (448 KB), internal SRAM (520 KB), RTC FAST memory (8 KB) and RTC SLOW memory (8 KB).

The 448 KB internal ROM is divided into two parts: Internal ROM 0 (384 KB) and Internal ROM 1 (64 KB). The 520 KB internal SRAM is divided into three parts: Internal SRAM 0 (192 KB), Internal SRAM 1 (128 KB), and Internal SRAM 2 (200 KB). RTC FAST Memory and RTC SLOW Memory are both implemented as SRAM.

Table 3 lists all embedded memories and their address ranges on the data and instruction buses.

Table 3: Embedded Memory Address Mapping

Bus Type	Boundary Address		Size	Target	Comment
	Low Address	High Address			
Data	0x3FF8_0000	0x3FF8_1FFF	8 KB	RTC FAST Memory	PRO_CPU Only
	0x3FF8_2000	0x3FF8_FFFF	56 KB	Reserved	-
Data	0x3FF9_0000	0x3FF9_FFFF	64 KB	Internal ROM 1	-
	0x3FFA_0000	0x3FFA_DFFF	56 KB	Reserved	-
Data	0x3FFA_E000	0x3FFD_FFFF	200 KB	Internal SRAM 2	DMA
Data	0x3FFE_0000	0x3FFF_FFFF	128 KB	Internal SRAM 1	DMA
Bus Type	Boundary Address		Size	Target	Comment
	Low Address	High Address			
Instruction	0x4000_0000	0x4000_7FFF	32 KB	Internal ROM 0	Remap
Instruction	0x4000_8000	0x4005_FFFF	352 KB	Internal ROM 0	-
	0x4006_0000	0x4006_FFFF	64 KB	Reserved	-
Instruction	0x4007_0000	0x4007_FFFF	64 KB	Internal SRAM 0	Cache
Instruction	0x4008_0000	0x4009_FFFF	128 KB	Internal SRAM 0	-
Instruction	0x400A_0000	0x400A_FFFF	64 KB	Internal SRAM 1	-
Instruction	0x400B_0000	0x400B_7FFF	32 KB	Internal SRAM 1	Remap
Instruction	0x400B_8000	0x400B_FFFF	32 KB	Internal SRAM 1	-
Instruction	0x400C_0000	0x400C_1FFF	8 KB	RTC FAST Memory	PRO_CPU Only
Bus Type	Boundary Address		Size	Target	Comment
	Low Address	High Address			
Data Instruc- tion	0x5000_0000	0x5000_1FFF	8 KB	RTC SLOW Memory	-

1.3.2.1 Internal ROM 0

The capacity of Internal ROM 0 is 384 KB. It is accessible by both CPUs through the address range 0x4000_0000 ~ 0x4005_FFFF, which is on the instruction bus.

The address range of the first 32 KB of the ROM 0 (0x4000_0000 ~ 0x4000_7FFF) can be remapped in order to access a part of Internal SRAM 1 that normally resides in a memory range of 0x400B_0000 ~ 0x400B_7FFF. While remapping, the 32 KB SRAM cannot be accessed by an address range of 0x400B_0000 ~ 0x400B_7FFF any more, but it can still be accessible through the data bus (0x3FFE_8000 ~ 0x3FFE_FFFF). This can be done on a per-CPU basis: setting bit 0 of register DPORT_PRO_BOOT_REMAP_CTRL_REG or DPORT_APP_BOOT_REMAP_CTRL_REG will remap SRAM for the PRO_CPU and APP_CPU, respectively.

1.3.2.2 Internal ROM 1

The capacity of Internal ROM 1 is 64 KB. It can be read by either CPU at an address range 0x3FF9_0000 ~ 0x3FF9_FFFF of the data bus.

1.3.2.3 Internal SRAM 0

The capacity of Internal SRAM 0 is 192 KB. Hardware can be configured to use the first 64 KB to cache external memory access. When not used as cache, the first 64 KB can be read and written by either CPU at addresses 0x4007_0000 ~ 0x4007_FFFF of the instruction bus. The remaining 128 KB can always be read and written by either CPU at addresses 0x4008_0000 ~ 0x4009_FFFF of instruction bus.

1.3.2.4 Internal SRAM 1

The capacity of Internal SRAM 1 is 128 KB. Either CPU can read and write this memory at addresses 0x3FFE_0000 ~ 0x3FFF_FFFF of the data bus, and also at addresses 0x400A_0000 ~ 0x400B_FFFF of the instruction bus.

The address range accessed via the instruction bus is in reverse order (word-wise) compared to access via the data bus. That is to say, address

0x3FFE_0000 and 0x400B_FFFC access the same word

0x3FFE_0004 and 0x400B_FFF8 access the same word

0x3FFE_0008 and 0x400B_FFF4 access the same word

.....

0x3FFF_FFF4 and 0x400A_0008 access the same word

0x3FFF_FFF8 and 0x400A_0004 access the same word

0x3FFF_FFFC and 0x400A_0000 access the same word

The data bus and instruction bus of the CPU are still both little-endian, so the byte order of individual words is not reversed between address spaces. For example, address

0x3FFE_0000 accesses the least significant byte in the word accessed by 0x400B_FFFC.

0x3FFE_0001 accesses the second least significant byte in the word accessed by 0x400B_FFFC.

0x3FFE_0002 accesses the second most significant byte in the word accessed by 0x400B_FFFC.

0x3FFE_0003 accesses the most significant byte in the word accessed by 0x400B_FFFC.

0x3FFE_0004 accesses the least significant byte in the word accessed by 0x400B_FFF8.

0x3FFE_0005 accesses the second least significant byte in the word accessed by 0x400B_FFF8.

0x3FFE_0006 accesses the second most significant byte in the word accessed by 0x400B_FFF8.

0x3FFE_0007 accesses the most significant byte in the word accessed by 0x400B_FFF8.

.....

0x3FFF_FFF8 accesses the least significant byte in the word accessed by 0x400A_0004.

0x3FFF_FFF9 accesses the second least significant byte in the word accessed by 0x400A_0004.

0x3FFF_FFFA accesses the second most significant byte in the word accessed by 0x400A_0004.

0x3FFF_FFFB accesses the most significant byte in the word accessed by 0x400A_0004.

0x3FFF_FFFC accesses the least significant byte in the word accessed by 0x400A_0000.

0x3FFF_FFFD accesses the second most significant byte in the word accessed by 0x400A_0000.

0x3FFF_FFFE accesses the second most significant byte in the word accessed by 0x400A_0000.

0x3FFF_FFFF accesses the most significant byte in the word accessed by 0x400A_0000.

Part of this memory can be remapped onto the ROM 0 address space. See [Internal Rom 0](#) for more information.

1.3.2.5 Internal SRAM 2

The capacity of Internal SRAM 2 is 200 KB. It can be read and written by either CPU at addresses 0x3FFA_E000 ~ 0x3FFD_FFFF on the data bus.

1.3.2.6 DMA

DMA uses the same addressing as the CPU data bus to read and write Internal SRAM 1 and Internal SRAM 2. This means DMA uses an address range of 0x3FFE_0000 ~ 0x3FFF_FFFF to read and write Internal SRAM 1 and an address range of 0x3FFA_E000 ~ 0x3FFD_FFFF to read and write Internal SRAM 2.

In the ESP32, 13 peripherals are equipped with DMA. Table 4 lists these peripherals.

Table 4: Module with DMA

UART0	UART1	UART2
SPI1	SPI2	SPI3
I2S0	I2S1	
SDIO Slave	SDMMC	
EMAC		
BT	WIFI	

1.3.2.7 RTC FAST Memory

RTC FAST Memory is 8 KB of SRAM. It can be read and written by PRO_CPU only at an address range of 0x3FF8_0000 ~ 0x3FF8_1FFF on the data bus or at an address range of 0x400C_0000 ~ 0x400C_1FFF on the instruction bus. Unlike most other memory regions, RTC FAST memory cannot be accessed by the APP_CPU.

The two address ranges of PRO_CPU access RTC FAST Memory in the same order, so, for example, addresses 0x3FF8_0000 and 0x400C_0000 access the same word. **On the APP_CPU, these address ranges do not provide access to RTC FAST Memory or any other memory location.**

1.3.2.8 RTC SLOW Memory

RTC SLOW Memory is 8 KB of SRAM which can be read and written by either CPU at an address range of 0x5000_0000 ~ 0x5000_1FFF. This address range is shared by both the data bus and the instruction bus.

1.3.3 External Memory

The ESP32 can access external SPI flash and SPI SRAM as external memory. Table 5 provides a list of external memories that can be accessed by either CPU at a range of addresses on the data and instruction buses. When a CPU accesses external memory through the Cache and MMU, the cache will map the CPU's address to an external physical memory address (in the external memory's address space), according to the MMU settings. Due to this address mapping, the ESP32 can address up to 16 MB External Flash and 8 MB External SRAM.

Table 5: External Memory Address Mapping

Bus Type	Boundary Address		Size	Target	Comment
	Low Address	High Address			
Data	0x3F40_0000	0x3F7F_FFFF	4 MB	External Flash	Read
Data	0x3F80_0000	0x3FBF_FFFF	4 MB	External SRAM	Read and Write
Bus Type	Boundary Address		Size	Target	Comment
	Low Address	High Address			
Instruction	0x400C_2000	0x40BF_FFFF	11512 KB	External Flash	Read

1.3.4 Cache

As shown in Figure 3, each of the two CPUs in ESP32 has 32 KB of cache for accessing external storage. PRO CPU uses bit PRO_CACHE_ENABLE in register DPORT_PRO_CACHE_CTRL_REG to enable the Cache, while APP CPU uses bit APP_CACHE_ENABLE in register DPORT_APP_CACHE_CTRL_REG to enable the same function.

**Figure 3: Cache Block Diagram**

ESP32 uses a two-way set-associative cache. When the Cache function is to be used either by PRO CPU or APP CPU, bit CACHE_MUX_MODE[1:0] in register DPORT_CACHE_MUX_MODE_REG can be set to select POOL0 or POOL1 in the Internal SRAM0 as the cache memory. When both PRO CPU and APP CPU use the Cache function, POOL0 and POOL1 in the Internal SRAM0 will be used simultaneously as the cache memory, while they can also be used by the instruction bus. This is depicted in table 6 below.

Table 6: Cache memory mode

CACHE_MUX_MODE	POOL0	POOL1
0	PRO CPU	APP CPU
1	PRO CPU/APP CPU	-
2	-	PRO CPU/APP CPU
3	APP CPU	PRO CPU

As described in table 6, when bit `CACHE_MUX_MODE` is set to 1 or 2, PRO CPU and APP CPU cannot enable the Cache function at the same time. When the Cache function is enabled, POOL0 or POOL1 can only be used as the cache memory, and cannot be used by the instruction bus as well.

ESP32 Cache supports the Flush function. It is worth noting that when the Flush function is used, the data written in the cache will be disposed rather than being rewritten into the External SRAM. To enable the Flush function, first clear bit `x_CACHE_FLUSH_ENA` in register `DPORT_x_CACHE_CTRL_REG`, then set this bit to 1. Afterwards, the system hardware will set bit `x_CACHE_FLUSH_DONE` to 1, where `x` can be "PRO" or "APP", indicating that the cache flush operation has been completed.

For more information about the address mapping of ESP32 Cache, please refer to [Embedded Memory](#) and [External Memory](#).

1.3.5 Peripherals

The ESP32 has 41 peripherals. Table 7 specifically describes the peripherals and their respective address ranges. Nearly all peripheral modules can be accessed by either CPU at the same address with just a single exception; this being the PID Controller.

Table 7: Peripheral Address Mapping

Bus Type	Boundary Address		Size	Target	Comment
	Low Address	High Address

1.3.5.1 Asymmetric PID Controller Peripheral

There are two PID Controllers in the system. They serve the PRO_CPU and the APP_CPU, respectively. **The PRO_CPU and the APP_CPU can only access their own PID Controller and not that of their counterpart.** Each CPU uses the same memory range 0x3FF1_F000 ~ 3FF1_FFFF to access its own PID Controller.

1.3.5.2 Non-Contiguous Peripheral Memory Ranges

The SDIO Slave peripheral consists of three parts and the two CPUs use non-contiguous addresses to access these. The three parts are accessed at the address ranges 0x3FF4_B000 ~ 3FF4_BFFF, 0x3FF5_5000 ~ 3FF5_5FFF and 0x3FF5_8000 ~ 3FF5_8FFF of each CPU's data bus. Similarly to other peripherals, access to this peripheral is identical for both CPUs.

1.3.5.3 Memory Speed

The ROM as well as the SRAM are both clocked from CPU_CLK and can be accessed by the CPU in a single cycle. The RTC FAST memory is clocked from the APB_CLOCK and the RTC SLOW memory from the FAST_CLOCK, so access to these memories may be slower. DMA uses the APB_CLK to access memory.

Internally, the SRAM is organized in 32K-sized banks. Each CPU and DMA channel can simultaneously access the SRAM at full speed, provided they access addresses in different memory banks.

2. Interrupt Matrix

2.1 Introduction

The Interrupt Matrix embedded in the ESP32 independently allocates peripheral interrupt sources to the two CPUs' peripheral interrupts. This configuration is made to be highly flexible in order to meet many different needs.

2.2 Features

- Accepts 71 peripheral interrupt sources as input.
- Generates 26 peripheral interrupt sources per CPU as output (52 total).
- CPU NMI Interrupt Mask.
- Queries current interrupt status of peripheral interrupt sources.

The structure of the Interrupt Matrix is shown in Figure 4.

Figure 4: Interrupt Matrix Structure

2.3 Functional Description

2.3.1 Peripheral Interrupt Source

ESP32 has 71 peripheral interrupt sources in total. All peripheral interrupt sources are listed in table 8. 67 of 71 ESP32 peripheral interrupt sources can be allocated to either CPU.

The four remaining peripheral interrupt sources are CPU-specific, two per CPU. `GPIO_INTERRUPT_PRO` and `GPIO_INTERRUPT_PRO_NMI` can only be allocated to `PRO_CPU`. `GPIO_INTERRUPT_APP` and `GPIO_INTERRUPT_APP_NMI` can only be allocated to `APP_CPU`. As a result, `PRO_CPU` and `APP_CPU` each have 69 peripheral interrupt sources.

Table 8: PRO_CPU, APP_CPU Interrupt Configuration

PRO_CPU				APP_CPU			
Peripheral Interrupt Configuration Register	Status Register Name	No.	Name	No.	Status Register Name	Bit	Peripheral Interrupt Configuration Register

2.3.2 CPU Interrupt

Both of the two CPUs (PRO and APP) have 32 interrupts each, of which 26 are peripheral interrupts. All interrupts in a CPU are listed in Table 9.

Table 9: CPU Interrupts

No.	Category	Type	Priority Level
0	Peripheral	Level-Triggered	1

2.3.3 Allocate Peripheral Interrupt Sources to Peripheral Interrupt on CPU

In this section:

- Source_X stands for any particular peripheral interrupt source.
- PRO_X_MAP_REG (or APP_X_MAP_REG) stands for any particular peripheral interrupt configuration

register of the PRO_CPU (or APP_CPU). The peripheral interrupt configuration register corresponds to the peripheral interrupt source Source_X. In Table 8 the registers listed under “PRO_CPU (APP_CPU) - Peripheral Interrupt Configuration Register” correspond to the peripheral interrupt sources listed in “Peripheral Interrupt Source - Name”.

- Interrupt_P stands for CPU peripheral interrupt, numbered as Num_P. Num_P can take the ranges 0 ~ 5, 8 ~ 10, 12 ~ 14, 17 ~ 28, 30 ~ 31.
- Interrupt_I stands for the CPU internal interrupt numbered as Num_I. Num_I can take values 6, 7, 11, 15, 16, 29.

Using this terminology, the possible operations of the Interrupt Matrix controller can be described as follows:

- **Allocate peripheral interrupt source Source_X to CPU (PRO_CPU or APP_CPU)**
Set PRO_X_MAP_REG or APP_X_MAP_REG to Num_P. Num_P can be any CPU peripheral interrupt number. CPU interrupts can be shared between multiple peripherals (see below).
- **Disable peripheral interrupt source Source_X for CPU (PRO_CPU or APP_CPU)**
Set PRO_X_MAP_REG or APP_X_MAP_REG for peripheral interrupt source to any Num_I. The specific choice of internal interrupt number does not change behaviour, as none of the interrupt numbered as Num_I is connected to either CPU.
- **Allocate multiple peripheral sources Source_X_n ORed to PRO_CPU (APP_CPU) peripheral interrupt**
Set multiple PRO_X_n_MAP_REG (APP_X_n_MAP_REG) to the same Num_P. Any of these peripheral interrupts will trigger CPU Interrupt_P.

2.3.4 CPU NMI Interrupt Mask

The Interrupt Matrix temporarily masks all peripheral interrupt sources allocated to PRO_CPU's (or APP_CPU's) NMI interrupt, if it receives the signal PRO_CPU NMI Interrupt Mask (or APP_CPU NMI Interrupt Mask) from the peripheral PID Controller, respectively.

2.3.5 Query Current Interrupt Status of Peripheral Interrupt Source

The current interrupt status of a peripheral interrupt source can be read via the bit value in PRO_INTR_STATUS_REG__n (APP_INTR_STATUS_REG__n), as shown in the mapping in Table 8.

3. Reset and Clock

3.1 System Reset

3.1.1 Introduction

The ESP32 has three reset levels: CPU reset, Core reset, and System reset. None of these reset levels clear the RAM. Figure 5 shows the subsystems included in each reset level.

Figure 5: System Reset

- CPU reset: Only resets the registers of one or both of the CPU cores.
- Core reset: Resets all the digital registers, including CPU cores, external GPIO and digital GPIO. The RTC is not reset.
- System reset: Resets all the registers on the chip, including those of the RTC.

3.1.2 Reset Source

While most of the time the APP_CPU and PRO_CPU will be reset simultaneously, some reset sources are able to reset only one of the two cores. The reset reason for each core can be looked up individually: the PRO_CPU reset reason will be stored in RTC_CNTL_RESET_CAUSE_PROCPU, the reset reason for the APP_CPU in APP_CNTL_RESET_CAUSE_PROCPU. Table 10 shows the possible reset reason values that can be read from these registers.

Table 10: PRO_CPU and APP_CPU Reset Reason Values

PRO	APP	Source	Reset Type	Note
0x01	0x01	Chip Power On Reset	System Reset	-
0x10	0x10	RWDT System Reset	System Reset	See WDT Chapter .
0x0F	0x0F	Brown Out Reset	System Reset	See Power Management Chapter .
0x03	0x03	Software System Reset	Core Reset	Configure RTC_CNTL_SW_SYS_RST register.
0x05	0x05	Deep Sleep Reset	Core Reset	See Power Management Chapter .
0x07	0x07	MWDT0 Global Reset	Core Reset	See WDT Chapter .

PRO	APP	APP Source	Reset Type	Note
0x08	0x08	MWDT1 Global Reset	Core Reset	See WDT Chapter .
0x09	0x09	RWDT Core Reset	Core Reset	See WDT Chapter .
0x0B	-	MWDT0 CPU Reset	CPU Reset	See WDT Chapter .
0x0C	-	Software CPU Reset	CPU Reset	Configure RTC_CNTL_SW_APPCPU_RST register.
-	0x0B	MWDT1 CPU Reset	CPU Reset	See WDT Chapter .
-	0x0C	Software CPU Reset	CPU Reset	Configure RTC_CNTL_SW_APPCPU_RST register.
0x0D	0x0D	RWDT CPU Reset	CPU Reset	See WDT Chapter .
-	0xE	PRO CPU Reset	CPU Reset	Indicates that the PRO CPU has independently reset the APP CPU by configuring the DPORT_APPCPU_RESETTING register.

3.2 System Clock

3.2.1 Introduction

The ESP32 integrates multiple clock sources for the CPU cores, the peripherals and the RTC. These clocks can be configured to meet different requirements. Figure 6 shows the system clock structure.

Figure 6: System Clock

3.2.2 Clock Source

The ESP32 can use an external crystal oscillator, an internal PLL or an oscillating circuit as a clock source. Specifically, the clock sources available are:

- High Speed Clocks
 - PLL_CLK is an internal PLL clock with a frequency of 320 MHz.
 - XTL_CLK is a clock signal generated using an external crystal with a frequency range of 2 ~ 40 MHz.
- Low Power Clocks
 - XTL32K_CLK is a clock generated using an external crystal with a frequency of 32 KHz.
 - RTC8M_CLK is an internal clock with a default frequency of 8 MHz. This frequency is adjustable.
 - RTC8M_D256_CLK is divided from RTC8M_CLK 256. Its frequency is (RTC8M_CLK / 256). With the default RTC8M_CLK frequency of 8 MHz, this clock runs at 31.250 KHz.
 - RTC_CLK is an internal low power clock with a default frequency of 150 KHz. This frequency is adjustable.
- Audio Clock
 - APLL_CLK is an internal Audio PLL clock with a frequency range of 16 ~ 128 MHz.

3.2.3 CPU Clock

As Figure 6 shows, CPU_CLK is the master clock for both CPU cores. CPU_CLK clock can be as high as 160 MHz when the CPU is in high performance mode. Alternatively, the CPU can run at lower frequencies to reduce power consumption.

The CPU_CLK clock source is determined by the RTC_CNTL_SOC_CLK_SEL register. PLL_CLK, APLL_CLK, RTC8M_CLK and XTL_CLK can be set as the CPU_CLK source; see Table 11 and 12.

Table 11: CPU_CLK Source

RTC_CNTL_SOC_CLK_SEL Value	Clock Source
0	XTL_CLK
1	PLL_CLK
2	RTC8M_CLK
3	APLL_CLK

Table 12: CPU_CLK Derivation

Clock Source	SEL *	CPU Clock
0 / XTL_CLK	-	$CPU_CLK = XTL_CLK / (APB_CTRL_PRE_DIV_CNT+1)$ APB_CTRL_PRE_DIV_CNT range is 0 ~ 1023. Default is 0.
1 / PLL_CLK	0	$CPU_CLK = PLL_CLK / 4$ CPU_CLK frequency is 80 MHz
1 / PLL_CLK	1	$CPU_CLK = PLL_CLK / 2$ CPU_CLK frequency is 160 MHz
2 / RTC8M_CLK	-	$CPU_CLK = RTC8M_CLK / (APB_CTRL_PRE_DIV_CNT+1)$ APB_CTRL_PRE_DIV_CNT range is 0 ~ 1023. Default is 0.
3 / APLL_CLK	0	$CPU_CLK = APLL_CLK / 4$
3 / APLL_CLK	1	$CPU_CLK = APLL_CLK / 2$

*SEL: DPORT_CPUPERIOD_SEL value

3.2.4 Peripheral Clock

Peripheral clocks include APB_CLK, REF_TICK, LEDC_SCLK, APLL_CLK and PLL_D2_CLK.

Table 13 shows which clocks can be used by which peripherals.

Table 13: Peripheral Clock Usage

Peripherals	APB_CLK	REF_TICK	LEDC_SCLK	APLL_CLK	PLL_D2_CLK
EMAC	Y	N	N	Y	N
TIMG	Y	N	N	N	N
I2S	Y	N	N	Y	Y
UART	Y	Y	N	N	N
RMT	Y	Y	N	N	N
LED PWM	Y	Y	Y	N	N
PWM	Y	N	N	N	N
I2C	Y	N	N	N	N
SPI	Y	N	N	N	N
PCNT	Y	N	N	N	N
Efuse Controller	Y	N	N	N	N
SDIO Slave	Y	N	N	N	N
SDMMC	Y	N	N	N	N

3.2.4.1 APB_CLK Source

The APB_CLK is derived from CPU_CLK as detailed in Table 14. The division factor depends on the CPU_CLK source.

Table 14: APB_CLK Derivation

CPU_CLK Source	APB_CLK
PLL_CLK	PLL_CLK / 4
APLL_CLK	CPU_CLK / 2
XTAL_CLK	CPU_CLK
RTC8M_CLK	CPU_CLK

3.2.4.2 REF_TICK Source

REF_TICK is derived from APB_CLK via a divider. The divider value used depends on the APB_CLK source, which in turn depends on the CPU_CLK source.

By configuring correct divider values for each APB_CLK source, the user can ensure that the REF_TICK frequency does not change when CPU_CLK changes source, causing the APB_CLK frequency to change.

Clock divider registers are shown in Table 15.

Table 15: REF_TICK Derivation

CPU_CLK & APB_CLK Source	Clock Divider Register
PLL_CLK	APB_CTRL_PLL_TICK_NUM
XTAL_CLK	APB_CTRL_XTAL_TICK_NUM
APLL_CLK	APB_CTRL_APLL_TICK_NUM
RTC8M_CLK	APB_CTRL_CK8M_TICK_NUM

3.2.4.3 LEDC_SCLK Source

The LEDC_SCLK clock source is selected by the LEDC_APB_CLK_SEL register, as shown in Table 16.

Table 16: LEDC_SCLK Derivation

LEDC_APB_CLK_SEL Value	LEDC_SCLK Source
0	RTC8M_CLK
1	APB_CLK

3.2.4.4 APLL_SCLK Source

The APLL_CLK is sourced from PLL_CLK, with its output frequency configured using the APLL configuration registers.

3.2.4.5 PLL_D2_CLK Source

PLL_D2_CLK is half the PLL_CLK frequency.

3.2.4.6 Clock Source Considerations

Most peripherals will operate using the APB_CLK frequency as a reference. When this frequency changes, the peripherals will need to update their clock configuration to operate at the same frequency after the change. Peripherals accessing REF_TICK can continue operating normally when switching clock sources, without changing clock source. Please see Table 13 for details.

The LED PWM module can use RTC8M_CLK as a clock source when APB_CLK is disabled. In other words, when the system is in low-power consumption mode (see [Power Management Chapter](#)), normal peripherals will be halted (APB_CLK is turned off), but the LED PWM can work normally via RTC8M_CLK.

3.2.5 Wi-Fi BT Clock

Wi-Fi and BT can only operate if APB_CLK uses PLL_CLK as its clock source. Suspending PLL_CLK requires Wi-Fi and BT to both have entered low-power consumption mode first.

For LOW_POWER_CLK, one of RTC_CLK, [SLOW_CLK](#), RTC8M_CLK or XTL_CLK can be selected as the low-power consumption mode clock source for Wi-Fi and BT.

3.2.6 RTC Clock

The clock sources of SLOW_CLK and FAST_CLK are low-frequency clocks. The RTC module can operate when most other clocks are stopped.

SLOW_CLK is used to clock the Power Management module. It can be sourced from RTC_CLK, XTL32K_CLK or RTC8M_D256_CLK

FAST_CLK is used to clock the On-chip Sensor module. It can be sourced from a divided XTL_CLK or from RTC8M_CLK.

3.2.7 Audio PLL

The operation of audio and other time-critical data-transfer applications requires highly-configurable, low-jitter, and accurate clock sources. The clock sources derived from system clocks that serve digital peripherals may carry jitter and, therefore, they do not support a high-precision clock frequency setting.

Providing an integrated precision clock source can minimize system cost. To this end, ESP32 integrates an audio PLL intended for I2S peripherals. More details on how to clock the I2S module, using an APLL clock, can be found in [Chapter I2S](#). The Audio PLL formula is as follows:

$$f_{\text{out}} = \frac{f_{\text{xtal}}(\text{sdm2} + \frac{\text{sdm1}}{2^6} + \frac{\text{sdm0}}{2^{16}} + 4)}{2(\text{odiv} + 2)}$$

The parameters of this formula are defined below:

- f_{xtal} : the frequency of the crystal oscillator, usually 40 MHz;
- sdm0: the value is 0 ~ 255;
- sdm1: the value is 0 ~ 255;
- sdm2: the value is 0 ~ 63;
- odir: the value is 0 ~ 31;

The operating frequency range of the numerator is 350 MHz ~ 500 MHz:

$$350MHz < f_{xtal}(sdm2 + \frac{sdm1}{2^8} + \frac{sdm0}{2^{16}} + 4) < 500MHz$$

Please note that sdm1 and sdm0 are not available on revision0 of ESP32. Please consult the silicon revision in [ECO and Workarounds for Bugs in ESP32](#) for further details.

Audio PLL can be manually enabled or disabled via registers RTC_CNTL_PLLA_FORCE_PU and RTC_CNTL_PLLA_FORCE_PD, respectively. Disabling it takes priority over enabling it. When RTC_CNTL_PLLA_FORCE_PU and RTC_CNTL_PLLA_FORCE_PD are 0, PLL will follow the state of the system, i.e., when the system enters sleep mode, PLL will be disabled automatically; when the system wakes up, PLL will be enabled automatically.

4. IO_MUX and GPIO Matrix

4.1 Overview

The ESP32 chip features 34 physical GPIO pads. Each pad can be used as a general-purpose I/O, or be connected to an internal peripheral signal. The IO_MUX, RTC IO_MUX and the GPIO matrix are responsible for routing signals from the peripherals to GPIO pads. Together these systems provide highly configurable I/O.

Note that the I/O GPIO pads are 0-19, 21-23, 25-27, 32-39, while the output GPIOs are 0-19, 21-23, 25-27, 32-33. GPIO pads 34-39 are input-only.

This chapter describes the signal selection and connection between the digital pads (FUNC_SEL, IE, OE, WPU, WDU, etc.), 162 peripheral input and 176 output signals (control signals: SIG_IN_SEL, SIG_OUT_SEL, IE, OE, etc.), fast peripheral input/output signals (control signals: IE, OE, etc.), and RTC IO_MUX.

Figure 7: IO_MUX, RTC IO_MUX and GPIO Matrix Overview

1. The IO_MUX contains one register per GPIO pad. Each pad can be configured to perform a "GPIO" function (when connected to the GPIO Matrix) or a direct function (bypassing the GPIO Matrix). Some high-speed digital functions (Ethernet, SDIO, SPI, JTAG, UART) can bypass the GPIO Matrix for better high-frequency digital performance. In this case, the IO_MUX is used to connect these pads directly to the peripheral.)

See Section 4.10 for a list of IO_MUX functions for each I/O pad.

2. The GPIO Matrix is a full-switching matrix between the peripheral input/output signals and the pads.
 - For input to the chip: Each of the 162 internal peripheral inputs can select any GPIO pad as the input source.
 - For output from the chip: The output signal of each of the 34 GPIO pads can be from one of the 176 peripheral output signals.

See Section 4.9 for a list of GPIO Matrix peripheral signals.

3. RTC IO_MUX is used to connect GPIO pads to their low-power and analog functions. Only a subset of GPIO pads have these optional "RTC" functions.

See Section 4.11 for a list of RTC IO_MUX functions.

4.2 Peripheral Input via GPIO Matrix

4.2.1 Summary

To receive a peripheral input signal via the GPIO Matrix, the GPIO Matrix is configured to source the peripheral signal's input index (0-18, 23-36, 39-58, 61-90, 95-124, 140-155, 164-181, 190-195, 198-206) from one of the 34 GPIOs (0-19, 21-23, 25-27, 32-39).

The input signal is read from the GPIO pad through the IO_MUX. The IO_MUX must be configured to set the chosen pad to "GPIO" function. This causes the GPIO pad input signal to be routed into the GPIO Matrix, which in turn routes it to the selected peripheral input.

4.2.2 Functional Description

Figure 8 shows the logic for input selection via GPIO Matrix.

Figure 8: Peripheral Input via IO_MUX, GPIO Matrix

To read GPIO pad *X* into peripheral signal *Y*, follow the steps below:

- Configure the GPIO_FUNC*y*_IN_SEL_CFG register corresponding to peripheral signal *Y* in the GPIO Matrix:
 - Set the GPIO_FUNC*x*_IN_SEL field in this register, corresponding to the GPIO pad *X* to read from. Clear all other fields corresponding to other GPIO pads.
- Configure the GPIO_FUNC*x*_OUT_SEL_CFG register and clear the GPIO_ENABLE_DATA[*x*] field corresponding to GPIO pad *X* in the GPIO Matrix:
 - Set the GPIO_FUNC*x*_OEN_SEL bit in the GPIO_FUNC*x*_OUT_SEL_CFG register to force the pin's output state to be determined always by the GPIO_ENABLE_DATA[*x*] field.
 - The GPIO_ENABLE_DATA[*x*] field is a bit in either GPIO_ENABLE_REG (GPIOs 0-31) or GPIO_ENABLE1_REG (GPIOs 32-39). Clear this bit to disable the output driver for the GPIO pad.
- Configure the IO_MUX to select the GPIO Matrix. Set the IO_MUX_*x*_REG register corresponding to GPIO pad *X* as follows:

- Set the function field (IO_*x*_MCU_SEL) to the IO_MUX function corresponding to GPIO *x* (this is Function #3—numeric value 2—for all pins).
- Enable the input by setting the FUN_IE bit.
- Set or clear the FUN_WPU and FUN_WPD bits, as desired, to enable/disable internal pull-up/pull-down resistors.

Notes:

- One input pad can be connected to multiple input_signals.
- The input signal can be inverted with GPIO_FUNC*x*_IN_INV_SEL.
- It is possible to have a peripheral read a constantly low or constantly high input value without connecting this input to a pad. This can be done by selecting a special GPIO_FUNC*y*_IN_SEL input, instead of a GPIO number:
 - When GPIO_FUNC*x*_IN_SEL is 0x30, input_signal_*x* is always 0.
 - When GPIO_FUNC*x*_IN_SEL is 0x38, input_signal_*x* is always 1.

For example, to connect RMT peripheral channel 0 input signal (RMT_SIG_IN0_IDX, signal index 83) to GPIO 15, please follow the steps below. Note that GPIO 15 is also named the MTDO pin:

1. Set the GPIO_FUNC_83_IN_SEL_CFG register field GPIO_FUNC83_IN_SEL value to 15.
2. As this is an input-only signal, set GPIO_FUNC15_OEN_SEL bit in GPIO_FUNC15_OUT_SEL_CFG_REG.
3. Clear bit 15 of GPIO_ENABLE_REG (field GPIO_ENABLE_DATA[15]).
4. Set the IO_MUX_GPIO15 register MCU_SEL field to 2 (GPIO function) and also set the FUN_IE bit (input mode).

4.2.3 Simple GPIO Input

The GPIO_IN_REG/GPIO_IN1_REG register holds the input values of each GPIO pad.

The input value of any GPIO pin can be read at any time without configuring the GPIO Matrix for a particular peripheral signal. However, it is necessary to enable the input in the IO_MUX by setting the FUN_IE bit in the IO_MUX_*x*_REG register corresponding to pad *x*, as mentioned in Section 4.2.2.

4.3 Peripheral Output via GPIO Matrix

4.3.1 Summary

To output a signal from a peripheral via the GPIO Matrix, the GPIO Matrix is configured to route the peripheral output signal (0-18, 23-37, 61-121, 140-125, 224-228) to one of the 28 GPIOs (0-19, 21-23, 25-27, 32-33).

The output signal is routed from the peripheral into the GPIO Matrix. It is then routed into the IO_MUX, which is configured to set the chosen pad to "GPIO" function. This causes the output GPIO signal to be connected to the pad.

Note:

The peripheral output signals 224 to 228 can be configured to be routed in from one GPIO and output directly from another GPIO.

4.3.2 Functional Description

One of the 176 output signals can be selected to go through the GPIO matrix into the IO_MUX and then to a pad. Figure 9 illustrates the configuration.

Figure 9: Output via GPIO Matrix

To output peripheral signal Y to particular GPIO pad X , follow these steps:

- Configure the GPIO_FUNC x _OUT_SEL_CFG register and GPIO_ENABLE_DATA[x] field corresponding to GPIO X in the GPIO Matrix:
 - Set the GPIO_FUNC x _OUT_SEL field in GPIO_FUNC x _OUT_SEL_CFG to the numeric index (Y) of desired peripheral output signal Y .
 - If the signal should always be enabled as an output, set the GPIO_FUNC x _OEN_SEL bit in the GPIO_FUNC x _OUT_SEL_CFG register and the GPIO_ENABLE_DATA[x] field in the GPIO_ENABLE_REG register corresponding to GPIO pad X . To have the output enable signal decided by internal logic, clear the GPIO_FUNC x _OEN_SEL bit instead.
 - The GPIO_ENABLE_DATA[x] field is a bit in either GPIO_ENABLE_REG (GPIOs 0-31) or GPIO_ENABLE1_REG (GPIOs 32-39). Clear this bit to disable the output driver for the GPIO pad.
- For an open drain output, set the GPIO_PIN x _PAD_DRIVER bit in the GPIO_PIN x register corresponding to GPIO pad X . For push/pull mode (default), clear this bit.
- Configure the IO_MUX to select the GPIO Matrix. Set the IO_MUX x _REG register corresponding to GPIO pad X as follows:
 - Set the function field (IO $_x$ _MCU_SEL) to the IO_MUX function corresponding to GPIO X (this is Function #3—numeric value 2—for all pins).
 - Set the FUN_DRV field to the desired value for output strength (1-3). The higher the drive strength, the more current can be sourced/sunk from the pin.
 - If using open drain mode, set/clear the FUNC_WPU and FUNC_WPD bits to enable/disable the internal pull-up/down resistors.

Notes:

- The output signal from a single peripheral can be sent to multiple pads simultaneously.
- Only the 28 GPIOs can be used as outputs.
- The output signal can be inverted by setting the GPIO_FUNCx_OUT_INV_SEL bit.

4.3.3 Simple GPIO Output

The GPIO Matrix can also be used for simple GPIO output – setting a bit in the GPIO_OUT_DATA register will write to the corresponding GPIO pad.

To configure a pad as simple GPIO output, the GPIO Matrix GPIO_FUNCx_OUT_SEL register is configured with a special peripheral index value (0x100).

4.4 Direct I/O via IO_MUX

4.4.1 Summary

Some high speed digital functions (Ethernet, SDIO, SPI, JTAG, UART) can bypass the GPIO Matrix for better high-frequency digital performance. In this case, the IO_MUX is used to connect these pads directly to the peripheral.

Selecting this option is less flexible than using the GPIO Matrix, as the IO_MUX register for each GPIO pad can only select from a limited number of functions. However, better high-frequency digital performance will be maintained.

4.4.2 Functional Description

Two registers must be configured in order to bypass the GPIO Matrix for peripheral I/O:

1. IO_MUX for the GPIO pad must be set to the required pad function. (Please refer to section 4.10 for a list of pad functions.)
2. For inputs, the SIG_IN_SEL register must be set to route the input directly to the peripheral.

4.5 RTC IO_MUX for Low Power and Analog I/O

4.5.1 Summary

18 GPIO pads have low power capabilities (RTC domain) and analog functions which are handled by the RTC subsystem of ESP32. The IO_MUX and GPIO Matrix are not used for these functions; rather, the RTC_MUX is used to redirect the I/O to the RTC subsystem.

When configured as RTC GPIOs, the output pads can still retain the output level value when the chip is in Deep-sleep mode, and the input pads can wake up the chip from Deep-sleep.

Section 4.11 has a list of RTC_MUX pins and their functions.

4.5.2 Functional Description

Each pad with analog and RTC functions is controlled by the RTC_IO_TOUCH_PAD x _TO_GPIO bit in the RTC_GPIO_PIN x register. By default this bit is set to 1, routing all I/O via the IO_MUX subsystem as described in earlier subsections.

If the RTC_IO_TOUCH_PAD x _TO_GPIO bit is cleared, then I/O to and from that pad is routed to the RTC subsystem. In this mode, the RTC_GPIO_PIN x register is used for digital I/O and the analog features of the pad are also available. See Section 4.11 for a list of RTC pin functions.

See 4.11 for a table mapping GPIO pads to their RTC equivalent pins and analog functions. Note that the RTC_IO_PIN x registers use the RTC GPIO pin numbering, not the GPIO pad numbering.

4.6 Light-sleep Mode Pin Functions

Pins can have different functions when the ESP32 is in Light-sleep mode. If the GPIO xx _SLP_SEL bit in the IO_MUX register for a GPIO pad is set to 1, a different set of registers is used to control the pad when the ESP32 is in Light-sleep mode:

Table 17: IO_MUX Light-sleep Pin Function Registers

IO_MUX Function	Normal Execution OR GPIO xx _SLP_SEL = 0	Light-sleep Mode AND GPIO xx _SLP_SEL = 1
Output Drive Strength	GPIO xx _FUNC_DRV	GPIO xx _MCU_DRV
Pullup Resistor	GPIO xx _FUNC_WPU	GPIO xx _MCU_WPU
Pulldown Resistor	GPIO xx _FUNC_WPD	GPIO xx _MCU_WPD
Output Enable	(From GPIO Matrix _OEN field)	GPIO xx _MCU_OE

If GPIO xx _SLP_SEL is set to 0, the pin functions remain the same in both normal execution and Light-sleep mode.

4.7 Pad Hold Feature

Each IO pad (including the RTC pads) has an individual hold function controlled by a RTC register. When the pad is set to hold, the state is latched at that moment and will not change no matter how the internal signals change or how the IO_MUX configuration or GPIO configuration is modified. Users can use the hold function for the pads to retain the pad state through a core reset and system reset triggered by watchdog time-out or Deep-sleep events.

Note:

- For digital pads, to maintain the pad's input/output status in Deep-sleep mode, you can set REG_DG_PAD_FORCE_UNHOLD to 0 before powering down.
For RTC pads, the input and output values are controlled by the corresponding bits of register RTC_CNTL_HOLD_FORCE_REG, and you can set it to 1 to hold the value or set it to 0 to unhold the value.
- For digital pads, to disable the hold function after the chip is woken up, you can set REG_DG_PAD_FORCE_UNHOLD to 1. To maintain the hold function of the pad, you can change the corresponding bit in the register by setting RTC_CNTL_HOLD_FORCE_REG to 1.

4.8 I/O Pad Power Supply

IO pad power supply is shown in Figure 10.

Figure 10: ESP32 I/O Pad Power Sources

- Pads marked blue are RTC pads that have their individual analog function and can also act as normal digital IO pads. For details, please see Section 4.11.
- Pads marked pink and green have digital functions only.
- Pads marked green can be powered externally or internally via VDD_SDIO (see below).

4.8.1 VDD_SDIO Power Domain

VDD_SDIO can source or sink current, allowing this power domain to be powered externally or internally. To power VDD_SDIO externally, apply the same power supply of VDD3P3_RTC to the VDD_SDIO pad.

Without an external power supply, the internal regulator will supply VDD_SDIO. The VDD_SDIO voltage can be configured to be either 1.8V or the same as VDD3P3_RTC, depending on the state of the MTDI pad at reset – a high level configures 1.8V and a low level configures the voltage to be the same as VDD3P3_RTC. Setting the efuse bit determines the default voltage of the VDD_SDIO. In addition, software can change the voltage of the VDD_SDIO by configuring register bits.

4.9 Peripheral Signal List

Table 18 contains a list of Peripheral Input/Output signals used by the GPIO Matrix:

Table 18: GPIO Matrix Peripheral Signals

Signal	Input Signal	Output Signal	Direct I/O in IO_MUX
0	SPICLK_in	SPICLK_out	YES

Signal	Input Signal	Output Signal	Direct I/O in IO_MUX
1	SPIQ_in	SPIQ_out	YES
2	SPID_in	SPID_out	YES

Direct I/O in IO_MUX "YES" means that this signal is also available directly via IO_MUX. To apply the GPIO Matrix to these signals, their corresponding SIG_IN_SEL register must be cleared.

4.10 IO_MUX Pad List

Table 19 shows the IO_MUX functions for each I/O pad:

Table 19: IO_MUX Pad Summary

GPIO	Pad Name	Function 1	Function 2	Function 3	Function 4	Function 5	Function 6	Reset	Notes
0	GPIO0	GPIO0	CLK_OUT1	GPIO0	-	-	EMAC_TX_CLK	3	R
1	U0TXD	U0TXD	CLK_OUT3	GPIO1	-	-	EMAC_RXD2	3	-
2	GPIO2	GPIO2	HSPIWP	GPIO2	HS2_DATA0	SD_DATA0	-	2	R
3	U0RXD	U0RXD	CLK_OUT2	GPIO3	-	-	-	3	-

39	SENSOR_VN	GPIO39	-	GPIO39	-	-	-	0	R, I

Reset Configurations

"Reset" column shows each pad's default configurations after reset:

- **0** - IE=0 (input disabled).
- **1** - IE=1 (input enabled).
- **2** - IE=1, WPD=1 (input enabled, pulldown resistor).
- **3** - IE=1, WPU=1 (input enabled, pullup resistor).

Notes

- **R** - Pad has RTC/analog functions via RTC_MUX.
- **I** - Pad can only be configured as input GPIO.

Please refer to the ESP32 Pin Lists in [ESP32 Datasheet](#) for more details.

4.11 RTC_MUX Pin List

Table 20 shows the RTC pins and how they correspond to GPIO pads:

Table 20: RTC_MUX Pin Summary

RTC GPIO Num	GPIO Num	Pad Name	Analog Function		
			1	2	3
0	36	SENSOR_VP	ADC_H	ADC1_CH0	-
1	37	SENSOR_CAPP	ADC_H	ADC1_CH1	-
2	38	SENSOR_CAPN	ADC_H	ADC1_CH2	-

GPIO_STRAPPING GPIO strapping results: Bit5-bit0 of boot_sel_chip[5:0] correspond to MTDI, GPIO0, GPIO2, GPIO4, MTDO, GPIO5, respectively.

65

ESP32 Technical Reference Manual V3.1

GPIO_STATUS_REG GPIO0-31 interrupt status register. Each bit can be either of the two interrupt sources for the two CPUs. The enable bits in GPIO_STATUS_INTERRUPT, corresponding to the 0-4 bits in GPIO_PIN n _REG should be set to 1. (R/W)

Register 4.17: GPIO_STATUS_W1TS_REG (0x0048)

[illegible]

GPIO_STATUS_W1TS_REG GPIO0-31 interrupt status set register. For every bit that is 1 in the value written here, the corresponding bit in GPIO_STATUS_INTERRUPT will be set. (WO)

GPIO_STATUS_W1TC_REG GPIO0-31 interrupt status clear register. For every bit that is 1 in the value written here, the corresponding bit in GPIO_STATUS_INTERRUPT will be cleared. (WO)

Register 4.19: GPIO_STATUS1_REG (0x0050)

GPIO_STATUS_INTERRUPT GPIO32-39 interrupt status. (R/W)

Register 4.20: GPIO_STATUS1_W1TS_REG (0x0054)

GPIO_STATUS_INTERRUPT GPIO32-39 interrupt status set register. For every bit that is 1 in the value written here, the corresponding bit in GPIO_STATUS_INTERRUPT1 will be set. (WO)

Register 4.21: GPIO_STATUS1_W1TC_REG (0x0058)

GPIO_STATUS_INTERRUPT GPIO32-39 interrupt status clear register. For every bit that is 1 in the value written here, the corresponding bit in GPIO_STATUS_INTERRUPT1 will be cleared. (WO)

Register 4.22: GPIO_ACPU_INT_REG (0x0060)

GPIO_PIN n _INT_ENA Interrupt enable bits for pin n : (R/W)

bit0: APP CPU interrupt enable;
bit1: APP CPU non-maskable interrupt enable;
bit3: PRO CPU interrupt enable;
bit4: PRO CPU non-maskable interrupt enable.

GPIO_PIN_n_WAKEUP_ENABLE GPIO wake-up enable will only wake up the CPU from Light-sleep.
(R/W)

GPIO_PIN_n_INT_TYPE Interrupt type selection: (R/W)

- 0: GPIO interrupt disable;
- 1: rising edge trigger;
- 2: falling edge trigger;
- 3: any edge trigger;
- 4: low level trigger;
- 5: high level trigger.

GPIO_PIN_n_PAD_DRIVER 0: normal output; 1: open drain output. (R/W)

Register 4.31: GPIO_FUNC m _IN_SEL_CFG_REG (m : 0-255) (0x130+0x4* m)

Diagram of the 32-bit GPIO_PUPDR register structure:

- Bits 31-8: (reserved)
- Bits 7-6: GPIO_FUNC_m_IN_SEL
- Bits 5-0: GPIO_FUNC_m_IN_INV_SEL

The diagram shows the register value as 0x00000000, with the 'GPIO_FUNC_m_IN_INV_SEL' field containing 0x000000.

GPIO_SIG_mIN_SEL Bypass the GPIO Matrix. 0: route through GPIO Matrix, 1: connect signal directly to peripheral configured in the IO_MUX. (R/W)

GPIO_FUNC m _IN_INV_SEL Invert the input value. 1: invert; 0: do not invert. (R/W)

GPIO_FUNC*m***_IN_SEL** Selection control for peripheral input *m*. A value of 0-39 selects which of the 40 GPIO Matrix input pins this signal is connected to, or 0x38 for a constantly high input or 0x30 for a constantly low input. (R/W)

Register 4.32: GPIO_FUNC n _OUT_SEL_CFG_REG (n : 0-19, 21-23, 25-27, 32-33) (0x530+0x4* n)

GPIO_FUNC n _OEN_INV_SEL 1: Invert the output enable signal; 0: do not invert the output enable signal. (R/W)

GPIO_FUNC n _OEN_SEL 1: Force the output enable signal to be sourced from bit n of GPIO_ENABLE_REG; 0: use output enable signal from peripheral. (R/W)

GPIO_FUNC n _OUT_INV_SEL 1: Invert the output value; 0: do not invert the output value. (R/W)

GPIO_FUNC n _OUT_SEL Selection control for GPIO output n . A value of s ($0 \leq s < 256$) connects peripheral output s to GPIO output n . A value of 256 selects bit n of GPIO_OUT_REG/GPIO_OUT1_REG and GPIO_ENABLE_REG/GPIO_ENABLE1_REG as the output value and output enable. (R/W)

Register 4.33: IO_MUX_PIN_CTRL (0x3FF49000)

If you want to output clock for I2S0 to:

CLK_OUT1, then set PIN_CTRL[3:0] = 0x0;

CLK_OUT2, then set PIN_CTRL[3:0] = 0x0 and PIN_CTRL[7:4] = 0x0;

CLK_OUT3, then set PIN_CTRL[3:0] = 0x0 and PIN_CTRL[11:8] = 0x0.

If you want to output clock for I2S1 to:

CLK_OUT1, then set PIN_CTRL[3:0] = 0xF;

CLK_OUT2, then set PIN_CTRL[3:0] = 0xF and PIN_CTRL[7:4] = 0x0;

CLK_OUT3, then set PIN_CTRL[3:0] = 0xF and PIN_CTRL[11:8] = 0x0. (R/W)

Note:

Only the above mentioned combinations of clock source and clock output pins are possible.

The CLK_OUT1-3 can be found in the [IO_MUX Pad Summary](#).

Register 4.34: IO_MUX_X_REG (x: GPIO0-GPIO39) (0x10+4*x)

(reserved)																IO_X_MCU_SEL		IO_X_FUNC_DRV		IO_X_FUNC_IE		IO_X_FUNC_WPU		IO_X_FUNC_WPD		IO_X_MCU_DRV		IO_X_MCU_IE		IO_X_MCU_WPU		IO_X_MCU_WPD			
31															15	14	12	11	10	9	8	7	6	5	4	3	2	1	0						
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0																0x0		0x2		0		0		0		0x0		0		0		0		Reset	

IO_X_MCU_SEL Select the IO_MUX function for this signal. 0 selects Function 1, 1 selects Function 2, etc. (R/W)

IO_X_FUNC_DRV Select the drive strength of the pad. A higher value corresponds with a higher strength. (R/W)

IO_X_FUNC_IE Input enable of the pad. 1: input enabled; 0: input disabled. (R/W)

IO_X_FUNC_WPU Pull-up enable of the pad. 1: internal pull-up enabled; 0: internal pull-up disabled. (R/W)

IO_X_FUNC_WPD Pull-down enable of the pad. 1: internal pull-down enabled, 0: internal pull-down disabled. (R/W)

IO_X_MCU_DRV Select the drive strength of the pad during sleep mode. A higher value corresponds with a higher strength. (R/W)

IO_X_MCU_IE Input enable of the pad during sleep mode. 1: input enabled; 0: input disabled. (R/W)

IO_X_MCU_WPU Pull-up enable of the pad during sleep mode. 1: internal pull-up enabled; 0: internal pull-up disabled. (R/W)

IO_X_MCU_WPD Pull-down enable of the pad during sleep mode. 1: internal pull-down enabled; 0: internal pull-down disabled. (R/W)

IO_X_SLP_SEL Sleep mode selection of this pad. Set to 1 to put the pad in sleep mode. (R/W)

IO_X_MCU_OE Output enable of the pad in sleep mode. 1: enable output; 0: disable output. (R/W)

Register 4.35: RTCIO_RTC_GPIO_OUT_REG (0x0000)

RTCIO_RTC_GPIO_OUT_DATA																											(reserved)																			
31																	14										27										14

x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

RTCIO_RTC_GPIO_OUT_DATA_W1TS GPIO0-17 output set register. For every bit that is 1 in the value written here, the corresponding bit in RTCIO_RTC_GPIO_OUT will be set. (WO)

Register 4.37: RTCIO_RTC_GPIO_OUT_W1TC_REG (0x0008)

RTCIO_RTC_GPIO_OUT_DATA_W1TC														(reserved)																	
3114														2714																	
x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

RTCIO_RTC_GPIO_OUT_DATA_W1TC GPIO0-17 output clear register. For every bit that is 1 in the value written here, the corresponding bit in RTCIO_RTC_GPIO_OUT will be cleared. (WO)

Register 4.38: RTCIO_RTC_GPIO_ENABLE_REG (0x000C)

RTCIO_RTC_GPIO_ENABLE														(reserved)																																									
31														14														27														14													
x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset																			

RTCIO_RTC_GPIO_ENABLE GPIO0-17 output enable. Bit14 is GPIO[0], bit15 is GPIO[1], etc. 1 means this GPIO pad is output. (R/W)

Register 4.39: RTCIO_RTC_GPIO_ENABLE_W1TS_REG (0x0010)

RTCIO_RTC_GPIO_ENABLE_W1TS GPIO0-17 output enable set register. For every bit that is 1 in the value written here, the corresponding bit in RTCIO_RTC_GPIO_ENABLE will be set. (WO)

Register 4.40: RTCIO_RTC_GPIO_ENABLE_W1TC_REG (0x0014)

RTCIO_RTC_GPIO_ENABLE_W1TC GPIO0-17 output enable clear register. For every bit that is 1 in the value written here, the corresponding bit in RTCIO_RTC_GPIO_ENABLE will be cleared. (WO)

Register 4.41: RTCIO_RTC_GPIO_STATUS_REG (0x0018)

RTCIO_RTC_GPIO_STATUS_INT GPIO0-17 interrupt status. Bit14 is GPIO[0], bit15 is GPIO[1], etc. This register should be used together with RTCIO_RTC_GPIO_PIN n _INT_TYPE in RTCIO_RTC_GPIO_PIN n _REG. 1: corresponding interrupt; 0: no interrupt. (R/W)

Register 4.42: RTCIO_RTC_GPIO_STATUS_W1TS_REG (0x001C)

<i>RTCIO_RTC_GPIO_STATUS_INT_W1TS</i>														<i>(reserved)</i>															
31														14	27														14
x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reset

RTCIO_RTC_GPIO_STATUS_INT_W1TS GPIO0-17 interrupt set register. For every bit that is 1 in the value written here, the corresponding bit in RTCIO_RTC_GPIO_STATUS_INT will be set. (WO)

Register 4.43: RTCIO_RTC_GPIO_STATUS_W1TC_REG (0x0020)

x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reset

RTCIO_RTC_GPIO_STATUS_INT_W1TC GPIO0-17 interrupt clear register. For every bit that is 1 in the value written here, the corresponding bit in RTCIO_RTC_GPIO_STATUS_INT will be cleared. (WO)

Register 4.44: RTCIO_RTC_GPIO_IN_REG (0x0024)

<i>RTCIO_RTC_GPIO_IN_NEXT</i>														<i>(reserved)</i>															
31														14	27														14
x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reset

RTCIO_RTC_GPIO_IN_NEXT GPIO0-17 input value. Bit14 is GPIO[0], bit15 is GPIO[1], etc. Each bit represents a pad input value, 1 for high level, and 0 for low level. (RO)

Register 4.45: RTCIO_RTC_GPIO_PIN_n_REG (n: 0-17) (28+4*n)

(reserved)																												RTCIO_RTC_GPIO_PIN _n _WAKEUP_ENABLE				RTCIO_RTC_GPIO_PIN _n _INT_TYPE				(reserved)				RTCIO_RTC_GPIO_PIN _n _PAD_DRIVER				(reserved)					
31																												11		10	9	7	6	3			2	3	2	Reset									
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x	x	x	0	0	0	0	x	0	0																

RTCIO_RTC_GPIO_PIN_n_WAKEUP_ENABLE GPIO wake-up enable. This will only wake up the ESP32 from Light-sleep. (R/W)

RTCIO_RTC_GPIO_PIN_n_INT_TYPE GPIO interrupt type selection. (R/W)

- 0: GPIO interrupt disable;
- 1: rising edge trigger;
- 2: falling edge trigger;
- 3: any edge trigger;
- 4: low level trigger;
- 5: high level trigger.

RTCIO_RTC_GPIO_PIN_n_PAD_DRIVER Pad driver selection. 0: normal output; 1: open drain. (R/W)

Register 4.46: RTCIO_DIG_PAD_HOLD_REG (0x0074)

31	0
0	

Reset

RTCIO_DIG_PAD_HOLD_REG Selects the digital pads which should be put on hold. While 0 allows normal operation, 1 puts the pad on hold. (R/W)

Name	Description
Bit[0]	Set to 1 to enable the Hold function of pad U0RTD
Bit[1]	Set to 1 to enable the Hold function of pad U0TXD
Bit[2]	Set to 1 to enable the Hold function of pad SD_CLK
Bit[3]	Set to 1 to enable the Hold function of pad SD_DATA0
Bit[4]	Set to 1 to enable the Hold function of pad SD_DATA1
Bit[5]	Set to 1 to enable the Hold function of pad SD_DATA2
Bit[6]	Set to 1 to enable the Hold function of pad SD_DATA3
Bit[7]	Set to 1 to enable the Hold function of pad SD_CMD
Bit[8]	Set to 1 to enable the Hold function of pad GPIO5
Bit[9]	Set to 1 to enable the Hold function of pad GPIO16
Bit[10]	Set to 1 to enable the Hold function of pad GPIO17
Bit[11]	Set to 1 to enable the Hold function of pad GPIO18
Bit[12]	Set to 1 to enable the Hold function of pad GPIO19
Bit[13]	Set to 1 to enable the Hold function of pad GPIO20
Bit[14]	Set to 1 to enable the Hold function of pad GPIO21
Bit[15]	Set to 1 to enable the Hold function of pad GPIO22
Bit[16]	Set to 1 to enable the Hold function of pad GPIO23

Reset

RTCIO_SENSOR_SENSE n _HOLD Set to 1 to hold the output value on sense n ; 0 is for normal operation. (R/W)

RTCIO_SENSOR_SENSE n _MUX_SEL 1: route sense n to the RTC block; 0: route sense n to the digital IO_MUX. (R/W)

RTCIO_SENSOR_SENSE n _FUN_SEL Select the RTC IO_MUX function for this pad. 0: select Function 0; 1: select Function 1. (R/W)

RTCIO_SENSOR_SENSE n _SLP_SEL Selection of sleep mode for the pad: set to 1 to put the pad in sleep mode. (R/W)

RTCIO_SENSOR_SENSE n _SLP_IE Input enable of the pad in sleep mode. 1: enabled; 0: disabled. (R/W)

RTCIO_SENSOR_SENSE n _FUN_IE Input enable of the pad. 1: enabled; 0: disabled. (R/W)

78

ESP32 Technical Reference Manual V3.1

RTCIO_ADC_ADC_n_FUN_IE Input enable of the pad. 1 enabled; 0 disabled. (R/W)

79

ESP32 Technical Reference Manual V3.1

RTCIO_PAD_PDAC1_HOLD Set to 1 to hold the output value on the pad; set to 0 for normal operation. (R/W)

RTCIO_PAD_PDAC1_RDE 1: Pull-down on pad enabled; 0: Pull-down disabled. (R/W)

RTCIO_PAD_PDAC1_RUE 1: Pull-up on pad enabled; 0: Pull-up disabled. (R/W)

RTCIO PAD PDAC1 DAC PAD DAC1 output value. (R/W)

RTCIO_PAD_PDAC1_XPD_DAC Power on DAC1. Usually, PDAC1 needs to be tristated if we power on the DAC, i.e. IE=0, OE=0, RDE=0, RUE=0. (R/W)

RTCIO_PAD_PDAC1_MUX_SEL 0: route pad to the digital IO_MUX; (R/W)
1: route to the RTC block.

RTCIO_PAD_PDAC1_FUN_SEL the functional selection signal of the pad. (R/W)

RTCIO_PAD_PDAC1_SLP_SEL Sleep mode selection signal of the pad. Set this bit to 1 to put the pad to sleep. (R/W)

RTCIO_PAD_PDAC1_SLP_IE Input enable of the pad in sleep mode. 1: enabled; 0: disabled. (R/W)

RTCIO_PAD_PDAC1_SLP_OE Output enable of the pad. 1: enabled ; 0: disabled. (R/W)

RTCIO_PAD_PDAC1_FUN_IE Input enable of the pad. 1: enabled it; 0: disabled. (R/W)

RTCIO_PAD_PDAC1_DAC_XPD_FORCE Power on DAC1. Usually, we need to tristate PDAC1 if we power on the DAC, i.e. IE=0, OE=0, RDE=0, RUE=0. (R/W)

Register 4.51: RTCIO_PAD_DAC2_REG (0x0088)

[illegible]

RTCIO_PAD_PDAC2_DRV Select the drive strength of the pad. (R/W)

RTCIO_PAD_PDAC2_HOLD Set to 1 to hold the output value on the pad; 0 is for normal operation.
(R/W)

RTCIO_PAD_PDAC2_RDE 1: Pull-down on pad enabled; 0: Pull-down disabled. (R/W)

RTCIO_PAD_PDAC2_RUE 1: Pull-up on pad enabled; 0: Pull-up disabled. (R/W)

RTCIO_PAD_PDAC2_DAC PAD DAC2 output value. (R/W)

RTCIO_PAD_PDAC2_XPD_DAC Power on DAC2. PDAC2 needs to be tristated if we power on the DAC, i.e. IE=0, OE=0, RDE=0, RUE=0. (R/W)

RTCIO_PAD_PDAC2_MUX_SEL 0: route pad to the digital IO_MUX; (R/W)
1: route to the RTC block.

RTCIO_PAD_PDAC2_FUN_SEL Select the RTC function for this pad. 0: select Function 0; 1: select Function 1. (R/W)

RTCIO_PAD_PDAC2_SLP_SEL Sleep mode selection signal of the pad. Set this bit to 1 to put the pad to sleep. (R/W)

RTCIO_PAD_PDAC2_SLP_IE Input enable of the pad in sleep mode. 1: enabled; 0: disabled. (R/W)

RTCIO_PAD_PDAC2_SLP_OE Output enable of the pad. 1: enabled; 0: disabled. (R/W)

RTCIO_PAD_PDAC2_FUN_IE Input enable of the pad. 1: enabled; 0: disabled. (R/W)

RTCIO_PAD_PDAC2_DAC_XPD_FORCE Power on DAC2. Usually, we need to tristate PDAC2 if we power on the DAC, i.e. IE=0, OE=0, RDE=0, RUE=0. (R/W)

Register 4.52: RTCIO_XTAL_32K_PAD_REG (0x008C)

RTCIO_XTAL_X32N_DRV Select the drive strength of the pad. (R/W)

RTCIO_XTAL_X32N_HOLD Set to 1 to hold the output value on the pad; 0 is for normal operation. (R/W)

RTCIO_XTAL_X32N_RDE 1: Pull-down on pad enabled; 0: Pull-down disabled. (R/W)

RTCIO_XTAL_X32N_RUE 1: Pull-up on pad enabled; 0: Pull-up disabled. (R/W)

RTCIO_XTAL_X32P_DRV Select the drive strength of the pad. (R/W)

RTCIO_XTAL_X32P_HOLD Set to 1 to hold the output value on the pad, 0 is for normal operation. (R/W)

RTCIO_XTAL_X32P_RDE 1: Pull-down on pad enabled; 0: Pull-down disabled. (R/W)

RTCIO_XTAL_X32P_RUE 1: Pull-up on pad enabled; 0: Pull-up disabled. (R/W)

RTCIO_XTAL_DAC_XTAL_32K 32K XTAL bias current DAC value. (R/W)

RTCIO_XTAL_XPD_XTAL_32K Power up 32 KHz crystal oscillator. (R/W)

RTCIO_XTAL_X32N_MUX_SEL 0: route X32N pad to the digital IO_MUX; 1: route to RTC block. (R/W)

RTCIO_XTAL_X32P_MUX_SEL 0: route X32P pad to the digital IO_MUX; 1: route to RTC block. (R/W)

RTCIO_XTAL_X32N_FUN_SEL Select the RTC function. 0: select function 0; 1: select function 1. (R/W)

RTCIO_XTAL_X32N_SLP_SEL Sleep mode selection. Set this bit to 1 to put the pad to sleep. (R/W)

RTCIO_XTAL_X32N_SLP_IE Input enable of the pad in sleep mode. 1: enabled; 0: disabled. (R/W)

RTCIO_XTAL_X32N_SLP_OE Output enable of the pad. 1: enabled; 0: disabled. (R/W)

RTCIO_XTAL_X32N_FUN_IE Input enable of the pad. 1: enabled; 0: disabled. (R/W)

RTCIO_XTAL_X32P_FUN_SEL Select the RTC function. 0: select function 0; 1: select function 1. (R/W)

RTCIO_XTAL_X32P_SLP_SEL Sleep mode selection. Set this bit to 1 to put the pad to sleep. (R/W)

RTCIO_XTAL_X32P_SLP_IE Input enable of the pad in sleep mode. 1: enabled; 0: disabled. (R/W)

RTCIO_XTAL_X32P_SLP_OE Output enable of the pad in sleep mode. 1: enabled; 0: disabled. (R/W)

RTCIO_XTAL_X32P_FUN_IE Input enable of the pad. 1: enabled; 0: disabled. (R/W)

RTCIO_XTAL_DRES_XTAL_32K 32K XTAL resistor bias control. (R/W)

RTCIO_XTAL_DBIAS_XTAL_32K 32K XTAL self-bias reference control. (R/W)

Register 4.55: RTCIO_EXT_WAKEUP0_REG (0x00BC)

[illegible]

RTCIO_EXT_WAKEUP0_SEL GPIO[0-17] can be used to wake up the chip when the chip is in the sleep mode. This register prompts the pad source to wake up the chip when the latter is in deep/light sleep mode. 0: select GPIO0; 1: select GPIO2, etc. (R/W)

Register 4.56: RTCIO_XTL_EXT_CTR_REG (0x00C0)

31	27	53	27
Reset 0			

RTCIO_XTL_EXT_CTR_SEL Select the external crystal power down enable source to get into sleep mode. 0: select GPIO0; 1: select GPIO2, etc. The input value on this pin XOR RTCIO_RTC_EXT_XTAL_CONF_REG[30] is the crystal power down enable signal. (R/W)

Register 4.57: RTCIO_SAR_I2C_IO_REG (0x00C4)

RTCIO_SAR_I2C_SDA_SEL Selects a different pad as the RTC I2C SDA signal. 0: use pad TOUCH_PAD[1]; 1: use pad TOUCH_PAD[3]. (R/W)

RTCIO_SAR_I2C_SCL_SEL Selects a different pad as the RTC I2C SCL signal. 0: use pad TOUCH_PAD[0]; 1: use pad TOUCH_PAD[2]. (R/W)

5. DPort Register

5.1 Introduction

The ESP32 integrates a large number of peripherals, and enables the control of individual peripherals to achieve optimal characteristics in performance-vs-power-consumption scenarios. The DPort registers control clock management (clock gating), power management, and the configuration of peripherals and core-system modules. The system arranges each module with configuration registers contained in the DPort Register.

5.2 Features

DPort registers correspond to different peripheral blocks and core modules:

- System and memory
- Reset and clock
- Interrupt matrix
- DMA
- PID/MPU/MMU
- APP_CPU
- Peripheral clock gating and reset

5.3 Functional Description

5.3.1 System and Memory Register

The following registers are used for system and memory configuration, such as cache configuration and memory remapping. For a detailed description of these registers, please refer to Chapter [System and Memory](#).

- DPORT_PRO_BOOT_REMAP_CTRL_REG
- DPORT_APP_BOOT_REMAP_CTRL_REG
- DPORT_CACHE_MUX_MODE_REG

5.3.2 Reset and Clock Registers

The following register is used for Reset and Clock. For a detailed description of the register, please refer to [Reset and Clock](#).

- DPORT_CPU_PER_CONF_REG

5.3.3 Interrupt Matrix Register

The following registers are used for configuring and mapping interrupts through the interrupt matrix. For a detailed description of the registers, please refer to [Interrupt Matrix](#).

- DPORT_CPU_INTR_FROM_CPU_0_REG
- DPORT_CPU_INTR_FROM_CPU_1_REG
- DPORT_CPU_INTR_FROM_CPU_2_REG
- DPORT_CPU_INTR_FROM_CPU_3_REG
- DPORT_PRO_INTR_STATUS_0_REG
- DPORT_PRO_INTR_STATUS_1_REG
- DPORT_PRO_INTR_STATUS_2_REG
- DPORT_APP_INTR_STATUS_0_REG
- DPORT_APP_INTR_STATUS_1_REG
- DPORT_APP_INTR_STATUS_2_REG
- DPORT_PRO_MAC_INTR_MAP_REG
- DPORT_PRO_MAC_NMI_MAP_REG
- DPORT_PRO_BB_INT_MAP_REG
- DPORT_PRO_BT_MAC_INT_MAP_REG
- DPORT_PRO_BT_BB_INT_MAP_REG
- DPORT_PRO_BT_BB_NMI_MAP_REG
- DPORT_PRO_RWBT_IRQ_MAP_REG
- DPORT_PRO_RWBLE_IRQ_MAP_REG
- DPORT_PRO_RWBT_NMI_MAP_REG
- DPORT_PRO_RWBLE_NMI_MAP_REG
- DPORT_PRO_SLC0_INTR_MAP_REG
- DPORT_PRO_SLC1_INTR_MAP_REG
- DPORT_PRO_UHCI0_INTR_MAP_REG
- DPORT_PRO_UHCI1_INTR_MAP_REG
- DPORT_PRO_TG_T0_LEVEL_INT_MAP_REG
- DPORT_PRO_TG_T1_LEVEL_INT_MAP_REG
- DPORT_PRO_TG_WDT_LEVEL_INT_MAP_REG
- DPORT_PRO_TG_LACT_LEVEL_INT_MAP_REG
- DPORT_PRO_TG1_T0_LEVEL_INT_MAP_REG
- DPORT_PRO_TG1_T1_LEVEL_INT_MAP_REG
- DPORT_PRO_TG1_WDT_LEVEL_INT_MAP_REG

- DPORT_PRO_TG1_LACT_LEVEL_INT_MAP_REG
- DPORT_PRO_GPIO_INTERRUPT_MAP_REG
- DPORT_PRO_GPIO_INTERRUPT_NMI_MAP_REG
- DPORT_PRO_CPU_INTR_FROM_CPU_0_MAP_REG
- DPORT_PRO_CPU_INTR_FROM_CPU_1_MAP_REG
- DPORT_PRO_CPU_INTR_FROM_CPU_2_MAP_REG
- DPORT_PRO_CPU_INTR_FROM_CPU_3_MAP_REG
- DPORT_PRO_SPI_INTR_0_MAP_REG
- DPORT_PRO_SPI_INTR_1_MAP_REG
- DPORT_PRO_SPI_INTR_2_MAP_REG
- DPORT_PRO_SPI_INTR_3_MAP_REG
- DPORT_PRO_I2S0_INT_MAP_REG
- DPORT_PRO_I2S1_INT_MAP_REG
- DPORT_PRO_UART_INTR_MAP_REG
- DPORT_PRO_UART1_INTR_MAP_REG
- DPORT_PRO_UART2_INTR_MAP_REG

- DPORT_APP_TG1_LACT_EDGE_INT_MAP_REG
- DPORT_APP_MMU_IA_INT_MAP_REG
- DPORT_APP_MPU_IA_INT_MAP_REG
- DPORT_APP_CACHE_IA_INT_MAP_REG

5.3.4 DMA Registers

The following register is used for the SPI DMA configuration. For a detailed description of the register, please refer to [DMA](#).

- DPORT_SPI_DMA_CHAN_SEL_REG

5.3.5 PID/MPU/MMU Registers

The following registers are used for PID/MPU/MMU configuration and operation control. For a detailed description of the registers, please refer to [PID/MPU/MMU](#).

- DPORT_PRO_CACHE_CTRL_REG
- DPORT_APP_CACHE_CTRL_REG
- DPORT_IMMU_PAGE_MODE_REG
- DPORT_DMMU_PAGE_MODE_REG
- DPORT_AHB_MPU_TABLE_0_REG
- DPORT_AHB_MPU_TABLE_1_REG
- DPORT_AHBLITE_MPU_TABLE_UART_REG
- DPORT_AHBLITE_MPU_TABLE_SPI1_REG
- DPORT_AHBLITE_MPU_TABLE_SPI0_REG
- DPORT_AHBLITE_MPU_TABLE_GPIO_REG
- DPORT_AHBLITE_MPU_TABLE_FE2_REG

- DPORT_AHBLITE_MPU_TABLE_FE_REG
- DPORT_AHBLITE_MPU_TABLE_TIMER_REG
- DPORT_AHBLITE_MPU_TABLE_RTC_REG
- DPORT_AHBLITE_MPU_TABLE_IO_MUX_REG
- DPORT_AHBLITE_MPU_TABLE_WDG_REG
- DPORT_AHBLITE_MPU_TABLE_HINF_REG

5.3.6 APP_CPU Controller Registers

DPort registers are used for some basic configuration of the APP_CPU, such as performing a stalling execution, and for configuring the ROM boot jump address.

- APP_CPU is reset when DPORT_APPCPU_RESETTING=1. It is released when DPORT_APPCPU_RESETTING=0.
- When DPORT_APPCPU_CLKGATE_EN=0, the APP_CPU clock can be disabled to reduce power consumption.
- When DPORT_APPCPU_RUNSTALL=1, the APP_CPU can be put into a stalled state.
- When APP_CPU is booted up with a ROM code, it will jump to the address stored in the DPORT_APPCPU_BOOT_ADDR register.

5.3.7 Peripheral Clock Gating and Reset

Reset and clock gating registers covered in this section are active-high registers. Note that the reset bits are not self-cleared by hardware. When a clock-gating register bit is set to 1, the corresponding clock is enabled. Setting the register bit to 0 disables the clock. Setting a reset register bit to 1 puts the peripheral in a reset state, while setting the register bit to 0 disables the reset state, thus enabling normal operation.

- DPORT_PERI_CLK_EN_REG: enables the hardware accelerator clock.
 - BIT4, Digital Signature
 - BIT3, Secure boot
 - BIT2, RSA Accelerator
 - BIT1, SHA Accelerator
 - BIT0, AES Accelerator
- DPORT_PERI_RST_EN_REG: resets the accelerator.
 - BIT4, Digital Signature
AES Accelerator and RSA Accelerator will also be reset.
 - BIT3, Secure boot
AES Accelerator and SHA Accelerator will also be reset.
 - BIT2, RSA Accelerator
 - BIT1, SHA Accelerator
 - BIT0, AES Accelerator
- DPORT_PERIP_CLK_EN_REG=1: enables the peripheral clock.
 - BIT26, PWM3
 - BIT25, PWM2
 - BIT24, UART MEM
All UART-shared memory. As long as a UART is working, the UART memory clock cannot be in the gating state.
 - BIT23, UART2

- BIT22, SPI_DMA
- BIT21, I2S1
- BIT20, PWM1
- BIT19, CAN
- BIT18, I2C1
- BIT17, PWM0
- BIT16, SPI3
- BIT15, Timer Group1
- BIT14, eFuse
- BIT13, Timer Group0
- BIT12, UHCI1
- BIT11, LED_PWM
- BIT10, PULSE_CNT
- BIT9, Remote Controller
- BIT8, UHCI0
- BIT7, I2C0
- BIT6, SPI2
- BIT5, UART1
- BIT4, I2S0
- BIT3, WDG
- BIT2, UART
- BIT1, SPI
- BIT0, Timers
- DPORT_PERIP_RST_EN_REG: resets peripherals
 - BIT26, PWM3
 - BIT25, PWM2
 - BIT24, UART MEM
 - BIT23, UART2
 - BIT22, SPI_DMA
 - BIT21, I2S1
 - BIT20, PWM1
 - BIT19, CAN
 - BIT18, I2C1
 - BIT17, PWM0

- BIT16, SPI3
 - BIT15, Timer Group1
 - BIT14, eFuse
 - BIT13, Timer Group0
 - BIT12, UHCI1
 - BIT11, LED_PWM
 - BIT10, PULSE_CNT
 - BIT9, Remote Controller
 - BIT8, UHCI0
 - BIT7, I2C0
 - BIT6, SPI2
 - BIT5, UART1
 - BIT4, I2S0
 - BIT3, WDG
 - BIT2, UART
 - BIT1, SPI
 - BIT0, Timers
- DPORT_WIFI_CLK_EN_REG: used for Wi-Fi and BT clock gating.
 - DPORT_WIFI_RST_EN_REG: used for Wi-Fi and BT reset.

5.4 Register Summary

Name	Description	Address	Access
PRO_BOOT_REMAP_CTRL_REG	remap mode for PRO_CPU	0x3FF00000	R/W
APP_BOOT_REMAP_CTRL_REG	remap mode for APP_CPU	0x3FF00004	R/W
PERI_CLK_EN_REG	clock gate for peripherals	0x3FF0001C	R/W
PERI_RST_EN_REG	reset for peripherals	0x3FF00020	R/W
APPCPU_CTRL_REG_A_REG	reset for APP_CPU	0x3FF0002C	R/W
APPCPU_CTRL_REG_B_REG	clock gate for APP_CPU	0x3FF00030	R/W
APPCPU_CTRL_REG_C_REG	stall for APP_CPU	0x3FF00034	R/W
APPCPU_CTRL_REG_D_REG	boot address for APP_CPU	0x3FF00038	R/W
PRO_CACHE_CTRL_REG	determines the virtual address mode of the external SRAM	0x3FF00040	R/W
APP_CACHE_CTRL_REG	determines the virtual address mode of the external SRAM	0x3FF00058	R/W
CACHE_MUX_MODE_REG	the mode of the two caches sharing the memory	0x3FF0007C	R/W
IMMU_PAGE_MODE_REG	page size in the MMU for the internal SRAM 0	0x3FF00080	R/W
DMMU_PAGE_MODE_REG	page size in the MMU for the internal SRAM 2	0x3FF00084	R/W
SRAM_PD_CTRL_REG_0_REG	powers down internal SRAM_REG	0x3FF00098	R/W
SRAM_PD_CTRL_REG_1_REG	powers down internal SRAM_REG	0x3FF0009C	R/W
AHB_MPU_TABLE_0_REG	MPU for configuring DMA	0x3FF000B4	R/W
AHB_MPU_TABLE_1_REG	MPU for configuring DMA	0x3FF000B8	R/W
PERIP_CLK_EN_REG	clock gate for peripherals	0x3FF000C0	R/W
PERIP_RST_EN_REG	reset for peripherals	0x3FF000C4	R/W
SLAVE_SPI_CONFIG_REG	enables decryption in external flash	0x3FF000C8	R/W
WIFI_CLK_EN_REG	clock gate for Wi-Fi	0x3FF000CC	R/W
WIFI_RST_EN_REG	reset for Wi-Fi	0x3FF000D0	R/W
CPU_INTR_FROM_CPU_0_REG	interrupt 0 in both CPUs	0x3FF000DC	R/W
CPU_INTR_FROM_CPU_1_REG	interrupt 1 in both CPUs	0x3FF000E0	R/W
CPU_INTR_FROM_CPU_2_REG	interrupt 2 in both CPUs	0x3FF000E4	R/W
CPU_INTR_FROM_CPU_3_REG	interrupt 3 in both CPUs	0x3FF000E8	R/W
PRO_INTR_STATUS_REG_0_REG	PRO_CPU interrupt status 0	0x3FF000EC	RO
PRO_INTR_STATUS_REG_1_REG	PRO_CPU interrupt status 1	0x3FF000F0	RO
PRO_INTR_STATUS_REG_2_REG	PRO_CPU interrupt status 2	0x3FF000F4	RO
APP_INTR_STATUS_REG_0_REG	APP_CPU interrupt status 0	0x3FF000F8	RO
APP_INTR_STATUS_REG_1_REG	APP_CPU interrupt status 1	0x3FF000FC	RO
APP_INTR_STATUS_REG_2_REG	APP_CPU interrupt status 2	0x3FF00100	RO
PRO_MAC_INTR_MAP_REG	interrupt map	0x3FF00104	R/W

6. DMA Controller

6.1 Overview

Direct Memory Access (DMA) is used for high-speed data transfer between peripherals and memory, as well as from memory to memory. Data can be quickly moved with DMA without any CPU intervention, thus allowing for more efficient use of the cores when processing data.

In the ESP32, 13 peripherals are capable of using DMA for data transfer, namely, UART0, UART1, UART2, SPI1, SPI2, SPI3, I2S0, I2S1, SDIO slave, SD/MMC host, EMAC, BT, and Wi-Fi.

6.2 Features

The DMA controllers in the ESP32 feature:

- AHB bus architecture
- Support for full-duplex and half-duplex data transfers
- Programmable data transfer length in bytes
- Support for 4-beat burst transfer
- 328 KB DMA address space
- All high-speed communication modules powered by DMA

6.3 Functional Description

All modules that require high-speed data transfer in bulk contain a DMA controller. DMA addressing uses the same data bus as the CPU to read/write to the internal RAM.

Each DMA controller features different functions. However, the architecture of the DMA engine (DMA_ENGINE) is the same in all DMA controllers.

6.3.1 DMA Engine Architecture

Figure 11: DMA Engine Architecture

The DMA Engine accesses SRAM over the AHB BUS. In Figure 11, the RAM represents the internal SRAM banks available on ESP32. Further details on the SRAM addressing range can be found in Chapter [System and Memory](#). Software can use a DMA Engine by assigning a linked list to define the DMA operational parameters.

The DMA Engine transmits the data from the RAM to a peripheral, according to the contents of the out_link descriptor. Also, the DMA Engine stores the data received from a peripheral into a specified RAM location, according to the contents of the in_link descriptor.

6.3.2 Linked List

Figure 12: Linked List Structure

The DMA descriptor's linked lists (out_link and in_link) have the same structure. As shown in Figure 12, a linked-list descriptor consists of three words. The meaning of each field is as follows:

- owner (DW0) [31]: The allowed operator of the buffer corresponding to the current linked list.
 - 1'b0: the allowed operator is the CPU;
 - 1'b1: the allowed operator is the DMA controller.
- eof (DW0) [30]: End-Of-File character.
 - 1'b0: the linked-list item does not mark the end of the linked list;
 - 1'b1: the linked-list item is at the end of the linked list.
- reserved (DW0) [29:24]: Reserved bits.
 - Software should not write 1's in this space.
- length (DW0) [23:12]: The number of valid bytes in the buffer corresponding to the current linked list. The field value indicates the number of bytes to be transferred to/from the buffer denoted by word DW1.
- size (DW0) [11:0]: The size of the buffer corresponding to the current linked list.
 - NOTE:** The size must be word-aligned.
- buffer address pointer (DW1): Buffer address pointer. This is the address of the data buffer.
 - NOTE:** The buffer address must be word-aligned.
- next descriptor address (DW2): The address pointer of the next linked-list item. The value is 0, if the current linked-list item is the last on the list (eof=1).

When receiving data, if the data transfer length is smaller than the specified buffer size, DMA will not use the remaining space. This enables the DMA engine to be used for transferring an arbitrary number of data bytes.

6.4 UART DMA (UDMA)

The ESP32 has three UART interfaces that share two UDMA (UART DMA) controllers. The UHCIX_UART_CE (x is 0 or 1) is used for selecting the UDMA.

Figure 13: Data Transfer in UDMA Mode

Figure 13 shows the data transfer in UDMA mode. Before the DMA Engine receives data, software must initialize the receive-linked-list. `UHCIX_INLINK_ADDR` is used to point to the first `in_link` descriptor. The register must be programmed with the lower 20 bits of the address of the initial linked-list item. After `UHCIX_INLINK_START` is set, the Universal Host Controller Interface (UHCI) will transmit the data received by UART to the Decoder. After being parsed, the data will be stored in the RAM as specified by the receive-linked-list descriptor.

Before DMA transmits data, software must initialize the transmit-linked-list and the data to be transferred. `UHCIX_OUTLINK_ADDR` is used to point to the first `out_link` descriptor. The register must be programmed with the lower 20 bits of the address of the initial transmit-linked-list item. After `UHCIX_OUTLINK_START` is set, the DMA Engine will read data from the RAM location specified by the linked-list descriptor and then transfer the data through the Encoder. The DMA Engine will then shift the data out serially through the UART transmitter.

The UART DMA follows a format of (separator + data + separator). The Encoder is used for adding separators before and after data, as well as using special-character sequences to replace data that are the same as separators. The Decoder is used for removing separators before and after data, as well as replacing the special-character sequences with separators. There can be multiple consecutive separators marking the beginning or end of data. These separators can be configured through `UHCIX_SEPER_CH`, with the default values being `0xC0`. Data that are the same as separators can be replaced with `UHCIX_ESC_SEQ0_CHAR0` (`0xDB` by default) and `UHCIX_ESC_SEQ0_CHAR1` (`0xDD` by default). After the transmission process is complete, a `UHCIX_OUT_TOTAL_EOF_INT` interrupt will be generated. After the reception procedure is complete, a `UHCIX_IN_SUC_EOF_INT` interrupt will be generated.

6.5 SPI DMA Interface

ESP32 SPI modules can use DMA as well as the CPU for data exchange with peripherals. As can be seen from Figure 14, two DMA channels are shared by SPI1, SPI2 and SPI3 controllers. Each DMA channel can be used by any one SPI controller at any given time.

The ESP32 SPI DMA Engine also uses a linked list to receive/transmit data. Burst transmission is supported. The minimum data length for a single transfer is one byte. Consecutive data transfer is also supported.

`SPI1_DMA_CHAN_SEL[1:0]`, `SPI2_DMA_CHAN_SEL[1:0]` and `SPI3_DMA_CHAN_SEL[1:0]` in `DPORT_SPI_DMA_CHAN_SEL_REG` must be configured to enable the SPI DMA interface for a specific SPI controller. Each SPI controller corresponds to one domain which has two bits with values 0, 1 and 2. Value 3 is reserved and must not be configured for operation.

Considering SPI1 as an example,

if `SPI1_DMA_CHAN_SEL[1:0] = 0`, then SPI1 does not use any DMA channel;

if `SPI1_DMA_CHAN_SEL[1:0] = 1`, then SPI1 enables DMA channel1;

Figure 14: SPI DMA

if `SPI1_DMA_CHAN_SEL[1:0] = 2`, then SPI1 enables DMA channel2.

The `SPI_OUTLINK_START` bit in `SPI_DMA_OUT_LINK_REG` and the `SPI_INLINK_START` bit in `SPI_DMA_IN_LINK_REG` are used for enabling the DMA Engine. The two bits are self-cleared by hardware. When `SPI_OUTLINK_START` is set to 1, the DMA Engine starts processing the outbound linked list descriptor and prepares to transmit data. When `SPI_INLINK_START` is set to 1, then the DMA Engine starts processing the inbound linked-list descriptor and gets prepared to receive data.

Software should configure the SPI DMA as follows:

1. Reset the DMA state machine and FIFO parameters;
2. Configure the DMA-related registers for operation;
3. Configure the SPI-controller-related registers accordingly;
4. Set `SPI_USR` to enable DMA operation.

6.6 I2S DMA Interface

The ESP32 integrates two I2S modules, I2S0 and I2S1, each of which is powered by a DMA channel. The `REG_I2S_DSCR_EN` bit in `I2S_FIFO_CONF_REG` is used for enabling the DMA operation. ESP32 I2S DMA uses the standard linked-list descriptor to configure DMA operations for data transfer. Burst transfer is supported. However, unlike the SPI DMA channels, the data size for a single transfer is one word, or four bytes. `REG_I2S_RX_EOF_NUM[31:0]` bit in `I2S_RXEOF_NUM_REG` is used for configuring the data size of a single transfer operation, in multiples of one word.

`I2S_OUTLINK_START` bit in `I2S_OUT_LINK_REG` and `I2S_INLINK_START` bit in `I2S_IN_LINK_REG` are used for enabling the DMA Engine and are self-cleared by hardware. When `I2S_OUTLINK_START` is set to 1, the DMA Engine starts processing the outbound linked-list descriptor and gets prepared to send data. When `I2S_INLINK_START` is set to 1, the DMA Engine starts processing the inbound linked-list descriptor and gets prepared to receive data.

Software should configure the I2S DMA as follows:

1. Configure I2S-controller-related registers;

2. Reset the DMA state machine and FIFO parameters;
3. Configure DMA-related registers for operation;
4. In I2S master mode, set I2S_TX_START bit or I2S_RX_START bit to initiate an I2S operation;
In I2S slave mode, set I2S_TX_START bit or I2S_RX_START bit and wait for data transfer to be initiated by the host device.

For more information on I2S DMA interrupts, please see Section [DMA Interrupts](#), in Chapter [I2S](#).

7. SPI

7.1 Overview

Figure 15: SPI Architecture

As Figure 15 shows, ESP32 integrates four SPI controllers which can be used to communicate with external devices that use the SPI protocol. Controller SPI0 is used as a buffer for accessing external memory. Controller SPI1 can be used as a master. Controllers SPI2 and SPI3 can be configured as either a master or a slave. When used as a master, each SPI controller can drive multiple CS signals (CS0 ~ CS2) to activate multiple slaves. Controllers SPI1 ~ SPI3 share two DMA channels.

The SPI signal buses consist of D, Q, CS0-CS2, CLK, WP, and HD signals, as Table 26 shows. Controllers SPI0 and SPI1 share one signal bus through an arbiter; the signals of the shared bus start with "SPI". Controllers SPI2 and SPI3 use signal buses starting with "HSPI" and "VSPI" respectively. The I/O lines included in the above-mentioned signal buses can be mapped to pins via either the IO_MUX module or the GPIO matrix. (Please refer to Chapter [IO_MUX](#) for details.)

The SPI controller supports four-line half-duplex and full-duplex communication (MOSI, MISO, CS, and CLK lines) and three-line-bit half-duplex-only communication (DATA, CS, and CLK lines) in GP-SPI mode. In QSPI mode, a SPI controller accesses the flash or SRAM by using signal buses D, Q, CS0 ~ CS2, CLK, WP, and HD as a four-bit parallel SPI bus. The mapping between the GP-SPI signal bus and the QSPI signal bus is shown in Table 26.

Table 26: SPI Signal and Pin Signal Function Mapping

Four-line GP-SPI Full-duplex signal bus	Three-line GP-SPI Half-duplex signal bus	QSPI Signal bus	Pin function signals		
			SPI signal bus	HSPI signal bus	VSPI signal bus
MOSI	DATA	D	SPID	HSPID	VSPID
MISO	-	Q	SPIQ	HSPIQ	VSPIQ
CS	CS	CS	SPICS0	HSPICS0	VSPICS0
CLK	CLK	CLK	SPICLK	HSPICLK	VSPICLK
-	-	WP	SPIWP	HSPIWP	VSPIWP
-	-	HD	SPIHD	HSPIHD	VSPIHD

7.2 SPI Features

General Purpose SPI (GP-SPI)

- Programmable data transaction length, in multiples of 1 byte
- Four-line full-duplex communication and three-line half-duplex communication support
- Master mode and slave mode
- Programmable CPOL and CPHA
- Programmable clock

Parallel QSPI

- Communication format support for specific slave devices such as flash
- Programmable communication format
- Six variations of flash-read operations available
- Automatic shift between flash and SRAM access
- Automatic wait states for flash access

SPI DMA Support

- Support for sending and receiving data using linked lists

SPI Interrupt Hardware

- SPI interrupts
- SPI DMA interrupts

7.3 GP-SPI

The SPI1 ~ SPI3 controllers can communicate with other slaves as a standard SPI master. Every SPI master can be connected to three slaves at most by default. In non-DMA mode, the maximum length of data received/sent in one burst is 64 bytes. The data length is in multiples of 1 byte.

7.3.1 GP-SPI Master Mode

The SPI master mode supports four-line full-duplex communication and three-line half-duplex communication. The connections needed for four-line full-duplex communications are outlined in Figure 16.

Figure 16: SPI Master and Slave Full-duplex Communication

For four-line full-duplex communication, the length of received and sent data needs to be set by configuring the SPI_MISO_DLEN_REG, SPI_MOSI_DLEN_REG registers for master mode as well as

SPI_SLV_RDBUF_DLEN_REG, SPI_SLV_WRBUF_DLEN_REG registers for slave mode. The SPI_DOUTDIN bit and SPI_USR_MOSI bit in register SPI_USER_REG should also be configured. The SPI_USR bit in register SPI_CMD_REG needs to be configured to initialize data transfer.

If ESP32 SPI is configured as a slave using three-line half-duplex communication, the master-slave communication should meet a certain communication format. Please refer to 7.3.2.1 for details. For example, if ESP32 SPI acts as a slave, the communication format should be: command + address + received/sent data. The address length of the master should be the same as that of the slave; the value of the address should be 0.

Note:

When using ESP32 as a master in half-duplex communication, the communication format "command + address + sent data + received data" and "sent data + received data" are not applicable to DMA.

The byte order in which ESP32 SPI reads and writes is controlled by the SPI_RD_BYTE_ORDER bit and the SPI_WR_BYTE_ORDER bit in register SPI_USER_REG. The bit order is controlled by the SPI_RD_BIT_ORDER bit and the SPI_WR_BIT_ORDER bit in register SPI_CTRL_REG.

7.3.2 GP-SPI Slave Mode

ESP32 SPI2 ~ SPI3 can communicate with other host devices as a slave device. ESP32 SPI should use particular protocols when acting as a slave. Data received or sent at one time can be no more than 64 bytes when not using DMA. During a valid read/write process, the appropriate CS signal must be maintained at a low level. If the CS signal is pulled up during transmission, the internal state of the slave will be reset.

7.3.2.1 Communication Format Supported by GP-SPI Slave

The communication format of ESP32 SPI is: command + address + read/write data. When using half-duplex communication, the slave read and write operations use fixed hardware commands from which the address part can not be removed. The command is specified as follows:

1. command: length: 3 ~ 16 bits; Master Out Slave In (MOSI).
2. address: length: 1 ~ 32 bits; Master Out Slave In (MOSI).
3. data read/write: length 0 ~ 512 bits (64 bytes); Master Out Slave In (MOSI) or Master In Slave Out (MISO).

When ESP32 SPI is used as a slave in full-duplex communication, data transaction can be directly initiated without the master sending command and address. However, please note that the CS should be pulled low at least one SPI clock period before a read/write process is initiated, and should be pulled high at least one SPI clock period after the read/write process is completed.

7.3.2.2 Command Definitions Supported by GP-SPI Slave in Half-duplex Mode

The minimum length of a command received by the slave should be three bits. The lowest three bits correspond to fixed hardware read and write operations as follows:

1. 0x1 (received by slave): Writes data sent by the master into the slave status register via MOSI.
2. 0x2 (received by slave): Writes data sent by the master into the slave data buffer.
3. 0x3 (sent by slave): Sends data in the slave buffer to master via MISO.

4. 0x4 (sent by slave): Sends data in the slave status register to master via MISO.
5. 0x6 (received and then sent by slave): Writes master data on MOSI into data buffer and then sends the data in the slave data buffer to MISO.

The master can write the slave status register SPI_SLV_WR_STATUS_REG, and decide whether to read data from register SPI_SLV_WR_STATUS_REG or register SPI_RD_STATUS_REG via the SPI_SLV_STATUS_READBACK bit in the register SPI_SLAVE1_REG. The SPI master can maintain communication with the slave by reading and writing slave status register, thus realizing relatively complex communication with ease.

7.3.3 GP-SPI Data Buffer

Figure 17: SPI Data Buffer

ESP32 SPI has 16 x 32 bits of data buffer to buffer data-send and data-receive operations. As is shown in Figure 17, received data is written from the low byte of SPI_W0_REG by default and the writing ends with SPI_W15_REG. If the data length is over 64 bytes, the extra part will be written from SPI_W0_REG.

Data buffer blocks SPI_W0_REG ~ SPI_W7_REG and SPI_W8_REG ~ SPI_W15_REG data correspond to the lower part and the higher part respectively. They can be used separately, and are controlled by the SPI_USR_MOSI_HIGHPART bit and the SPI_USR_MISO_HIGHPART bit in register SPI_USER_REG. For example, if SPI is configured as a master, when SPI_USR_MOSI_HIGHPART = 1, SPI_W8_REG ~ SPI_W15_REG are used as buffer for sending data; when SPI_USR_MISO_HIGHPART = 1, SPI_W8_REG ~ SPI_W15_REG are used as buffer for receiving data. If SPI acts as a slave, when SPI_USR_MOSI_HIGHPART = 1, SPI_W8_REG ~ SPI_W15_REG are used as buffer for receiving data; when SPI_USR_MISO_HIGHPART = 1, SPI_W8_REG ~ SPI_W15_REG are used as buffer for sending data.

7.4 GP-SPI Clock Control

The maximum output clock frequency of ESP32 GP-SPI master is $f_{apb}/2$, and the maximum input clock frequency of the ESP32 GP-SPI slave is $f_{apb}/8$. The master can derive other clock frequencies via frequency division.

$$f_{spi} = \frac{f_{apb}}{(SPI_CLKCNT_N+1)(SPI_CLKDIV_PRE+1)}$$

SPI_CLKCNT_N and SPI_CLKDIV_PRE are two bits of register SPI_CLOCK_REG (Please refer to 7.8 Register Description for details). When the SPI_CLK_EQU_SYSCLK bit in the register SPI_CLOCK_REG is set to 1, and the other bits are set to 0, SPI output clock frequency is f_{apb} . For other clock frequencies, SPI_CLK_EQU_SYSCLK needs to be 0.

7.4.1 GP-SPI Clock Polarity (CPOL) and Clock Phase (CPHA)

The clock polarity and clock phase of ESP32 SPI are controlled by the SPI_CK_IDLE_EDGE bit in register SPI_PIN_REG, the SPI_CK_OUT_EDGE bit and the SPI_CK_I_EDGE bit in register SPI_USER_REG, the SPI_MISO_DELAY_MODE[1:0] bit, the SPI_MISO_DELAY_NUM[2:0] bit, the SPI_MOSI_DELAY_MODE[1:0] bit, and the SPI_MOSI_DELAY_NUM[2:0] bit in register SPI_CTRL2_REG. Table 27 and Table 28 show the clock polarity and phase as well as the corresponding register values for ESP32 SPI master and slave, respectively.

Table 27: Clock Polarity and Phase, and Corresponding SPI Register Values for SPI Master

Registers	mode0	mode1	mode2	mode3
SPI_CK_IDLE_EDGE	0	0	1	1
SPI_CK_OUT_EDGE	0	1	1	0
SPI_MISO_DELAY_MODE	2(0)	1(0)	1(0)	2(0)
SPI_MISO_DELAY_NUM	0	0	0	0
SPI_MOSI_DELAY_MODE	0	0	0	0
SPI_MOSI_DELAY_NUM	0	0	0	0

Table 28: Clock Polarity and Phase, and Corresponding SPI Register Values for SPI Slave

Registers	mode0	mode1	mode2	mode3
SPI_CK_IDLE_EDGE	0	0	1	1
SPI_CK_I_EDGE	0	1	1	0
SPI_MISO_DELAY_MODE	0	0	0	0
SPI_MISO_DELAY_NUM	0	0	0	0
SPI_MOSI_DELAY_MODE	2	1	1	2
SPI_MOSI_DELAY_NUM	0	0	0	0

1. mode0 means CPOL=0, CPHA=0. When SPI is idle, the clock output is logic low; data change on the falling edge of the SPI clock and are sampled on the rising edge;
2. mode1 means CPOL=0, CPHA=1. When SPI is idle, the clock output is logic low; data change on the rising edge of the SPI clock and are sampled on the falling edge;
3. mode2 means when CPOL=1, CPHA=0. When SPI is idle, the clock output is logic high; data change on the rising edge of the SPI clock and are sampled on the falling edge;
4. mode3 means when CPOL=1, CPHA=1. When SPI is idle, the clock output is logic high; data change on the falling edge of the SPI clock and are sampled on the rising edge.

7.4.2 GP-SPI Timing

The data signals of ESP32 GP-SPI can be mapped to physical pins via IO_MUX or via IO_MUX and GPIO matrix. When signals pass through the matrix, they will be delayed by two clk_{apb} clock cycles.

When GP-SPI is used as master and the data signals are not received by the SPI controller via GPIO matrix, if GP-SPI output clock frequency is not higher than $clk_{apb}/2$, register SPI_MISO_DELAY_MODE should be set to 0 when configuring the clock polarity. If GP-SPI output clock frequency is not higher than $clk_{apb}/4$, register

SPI_MISO_DELAY_MODE can be set to the corresponding value in Table 27 when configuring the clock polarity.

When GP-SPI is used in master mode and the data signals enter the SPI controller via the GPIO matrix:

1. If GP-SPI output clock frequency is $clk_{apb}/2$, register SPI_MISO_DELAY_MODE should be set to 0 and the dummy state should be enabled (SPI_USR_DUMMY = 1) for one clk_{spi} clock cycle (SPI_USR_DUMMY_CYCLELEN = 0) when configuring the clock polarity;
2. If GP-SPI output clock frequency is $clk_{apb}/4$, register SPI_MISO_DELAY_MODE should be set to 0 when configuring the clock polarity;
3. If GP-SPI output clock frequency is not higher than $clk_{apb}/8$, register SPI_MISO_DELAY_MODE can be set to the corresponding value in Table 27 when configuring the clock polarity.

When GP-SPI is used in slave mode, the maximum slave input clock frequency is $f_{apb}/8$. In addition, the clock signal and the data signals should be routed to the SPI controller via the same path, i.e., neither the clock signal nor the data signals enter the SPI controller via the GPIO matrix, or both the clock signal and the data signals enter the SPI controller via the GPIO matrix. This is important in ensuring that the signals are not delayed by different time periods before they reach the SPI hardware.

7.5 Parallel QSPI

ESP32 SPI controllers support SPI bus memory devices (such as flash and SRAM). The hardware connection between the SPI pins and the memories is shown by Figure 18.

Figure 18: Parallel QSPI

SPI1, SPI2 and SPI3 controllers can also be configured as QSPI master to connect to external memory. The maximum output clock frequency of the SPI memory interface is f_{apb} , with the same clock configuration as that of the GP-SPI master.

ESP32 QSPI supports flash-read operation in one-line mode, two-line mode, and four-line mode.

7.5.1 Communication Format of Parallel QSPI

To support communication with special slave devices, ESP32 QSPI implements a specifically designed communication protocol. The communication format of ESP32 QSPI master is command + address + read/write data, as shown in Figure 19, with details as follows:

1. Command: length: 1 ~ 16 bits; Master Out Slave In.
2. Address: length: 0 ~ 64 bits; Master Out Slave In.
3. Data read/write: length: 0 ~ 512 bits (64 bytes); Master Out Slave In or Master In Slave Out.

Figure 19: Communication Format of Parallel QSPI

When ESP32 SPI is configured as a master and communicates with slaves that use the SPI protocol, options such as command, address, data, etc., can be adjusted as required by the specific application. When ESP32 SPI reads special devices such as Flash and SRAM, a dummy state with a programmable length can be inserted between the address phase and the data phase.

7.6 GP-SPI Interrupt Hardware

ESP32 SPI generates two types of interrupts. One is the SPI interrupt and the other is the SPI DMA interrupt.

ESP32 SPI reckons the completion of send and/or receive operations as the completion of one operation from the controller and generates one interrupt. When ESP32 SPI is configured to slave mode, the slave will generate read/write status registers and read/write buffer data interrupts according to different operations.

7.6.1 SPI Interrupts

The SPI_*_INTEN bits in the SPI_SLAVE_REG register can be set to enable SPI interrupts. When an SPI interrupt happens, the interrupt flag in the corresponding SPI_*_DONE register will get set. This flag is writable, and an interrupt can be cleared by setting the bit to zero.

- SPI_TRANS_DONE_INT: Triggered when a SPI operation is done.
- SPI_SLV_WR_STA_INT: Triggered when a SPI slave status write is done.
- SPI_SLV_RD_STA_INT: Triggered when a SPI slave status read is done.
- SPI_SLV_WR_BUF_INT: Triggered when a SPI slave buffer write is done.
- SPI_SLV_RD_BUD_INT: Triggered when a SPI slave buffer read is done.

7.6.2 DMA Interrupts

- SPI_OUT_TOTAL_EOF_INT: Triggered when all linked lists are sent.
- SPI_OUT_EOF_INT: Triggered when one linked list is sent.
- SPI_OUT_DONE_INT: Triggered when the last linked list item has zero length.
- SPI_IN_SUC_EOF_INT: Triggered when all linked lists are received.
- SPI_IN_ERR_EOF_INT: Triggered when there is an error receiving linked lists.
- SPI_IN_DONE_INT: Triggered when the last received linked list had a length of 0.
- SPI_INLINK_DSCR_ERROR_INT: Triggered when the received linked list is invalid.
- SPI_OUTLINK_DSCR_ERROR_INT: Triggered when the linked list to be sent is invalid.
- SPI_INLINK_DSCR_EMPTY_INT: Triggered when no valid linked list is available.

7.7 Register Summary

Name	Description	SPI0	SPI1	SPI2	SPI3	Acc
Control and configuration registers						
SPI_CTRL_REG	Bit order and QIO/DIO/QOUT/DOUT mode settings	3FF43008	3FF42008	3FF65000	3FF65000	R/W
SPI_CTRL1_REG	CS delay configuration	3FF4300C	3FF4200C	3FF6400C	3FF6400C	R/W
SPI_CTRL2_REG	Timing configuration	3FF43014	3FF42014	3FF64014	3FF64014	R/W
SPI_CLOCK_REG	Clock configuration	3FF43018	3FF42018	3FF64018	3FF64018	R/W
SPI_PIN_REG	Polarity and CS configuration	3FF43034	3FF42034	3FF64034	3FF64034	R/W
Slave mode configuration registers						
SPI_SLAVE_REG	Slave mode configuration and interrupt status	3FF43038	3FF42038	3FF64038	3FF64038	R/W
SPI_SLAVE1_REG	Slave data bit lengths	3FF4303C	3FF4203C	3FF6403C	3FF6403C	R/W
SPI_SLAVE2_REG	Dummy cycle length configuration	3FF43040	3FF42040	3FF64040	3FF64040	R/W
SPI_SLAVE3_REG	Read/write status/buffer register	3FF43044	3FF42044	3FF64044	3FF64044	R/W
SPI_SLV_WR_STATUS_REG	Slave status/higher master address	3FF43030	3FF42030	3FF64030	3FF64030	R/W
SPI_SLV_WRBUF_DLEN_REG	Write-buffer operation length	3FF43048	3FF42048	3FF64048	3FF64048	R/W
SPI_SLV_RDBUF_DLEN_REG	Read-buffer operation length	3FF4304C	3FF4204C	3FF6404C	3FF6404C	R/W
SPI_SLV_RD_BIT_REG	Read data operation length	3FF43064	3FF42064	3FF64064	3FF64064	R/W

User-defined command mode registers						
SPI_CMD_REG	Start user-defined command	3FF43000	3FF42000	3FF64000	3FF64000	R/W
SPI_ADDR_REG	Address data	3FF43004	3FF42004	3FF64004	3FF64004	R/W
SPI_USER_REG	User defined command configuration	3FF4301C	3FF4201C	3FF6401C	3FF6401C	R/W
SPI_USER1_REG	Address and dummy cycle configuration	3FF43020	3FF42020	3FF64020	3FF64020	R/W
SPI_USER2_REG	Command length and value configuration	3FF43024	3FF42024	3FF64024	3FF64024	R/W
SPI_MOSI_DLEN_REG	MOSI length	3FF43028	3FF42028	3FF64028	3FF64028	R/W
SPI_W0_REG	SPI data register 0	3FF43080	3FF42080	3FF64080	3FF64080	R/W
SPI_W1_REG	SPI data register 1	3FF43084	3FF42084	3FF64084	3FF64084	R/W
SPI_W2_REG	SPI data register 2	3FF43088	3FF42088	3FF64088	3FF64088	R/W
SPI_W3_REG	SPI data register 3	3FF4308C	3FF4208C	3FF6408C	3FF6408C	R/W
SPI_W4_REG	SPI data register 4	3FF43090	3FF42090	3FF64090	3FF64090	R/W
SPI_W5_REG	SPI data register 5	3FF43094	3FF42094	3FF64094	3FF64094	R/W
SPI_W6_REG	SPI data register 6	3FF43098	3FF42098	3FF64098	3FF64098	R/W
SPI_W7_REG	SPI data register 7	3FF4309C	3FF4209C	3FF6409C	3FF6409C	R/W
SPI_W8_REG	SPI data register 8	3FF430A0	3FF420A0	3FF640A0	3FF640A0	R/W
SPI_W9_REG	SPI data register 9	3FF430A4	3FF420A4	3FF640A4	3FF640A4	R/W
SPI_W10_REG	SPI data register 10	3FF430A8	3FF420A8	3FF640A8	3FF640A8	R/W
SPI_W11_REG	SPI data register 11	3FF430AC	3FF420AC	3FF640AC	3FF640AC	R/W
SPI_W12_REG	SPI data register 12	3FF430B0	3FF420B0	3FF640B0	3FF640B0	R/W
SPI_W13_REG	SPI data register 13	3FF430B4	3FF420B4	3FF640B4	3FF640B4	R/W
SPI_W14_REG	SPI data register 14	3FF430B8	3FF420B8	3FF640B8	3FF640B8	R/W
SPI_W15_REG	SPI data register 15	3FF430BC	3FF420BC	3FF640BC	3FF640BC	R/W
SPI_TX_CRC_REG	CRC32 of 256 bits of data (SPI1 only)	3FF430C0	3FF420C0	3FF640C0	3FF640C0	R/W
Status registers						
SPI_RD_STATUS_REG	Slave status and fast read mode	3FF43010	3FF42010	3FF64010	3FF64010	R/W
DMA configuration registers						
SPI_DMA_CONF_REG	DMA configuration register	3FF43100	3FF42100	3FF64100	3FF64100	R/W
SPI_DMA_OUT_LINK_REG	DMA outlink address and configuration	3FF43104	3FF42104	3FF64104	3FF64104	R/W
SPI_DMA_IN_LINK_REG	DMA inlink address and configuration	3FF43108	3FF42108	3FF64108	3FF64108	R/W
SPI_DMA_STATUS_REG	DMA status	3FF4310C	3FF4210C	3FF6410C	3FF6410C	RO
SPI_IN_ERR_EOF_DES_ADDR_REG	Descriptor address where an error occurs	3FF43120	3FF42120	3FF64120	3FF64120	RO

SPI_IN_SUC_EOF_DES_ADDR_REG	Descriptor address where EOF occurs	3FF43124	3FF42124	3FF64124	3FF64124	RO
SPI_INLINK_DSCR_REG	Current descriptor pointer	3FF43128	3FF42128	3FF64128	3FF64128	RO
SPI_INLINK_DSCR_BF0_REG	Next descriptor data pointer	3FF4312C	3FF4212C	3FF6412C	3FF6412C	RO
SPI_INLINK_DSCR_BF1_REG	Current descriptor data pointer	3FF43130	3FF42130	3FF64130	3FF64130	RO
SPI_OUT_EOF_BFR_DES_ADDR_REG	Relative buffer address where EOF occurs	3FF43134	3FF42134	3FF64134	3FF64134	RO
SPI_OUT_EOF_DES_ADDR_REG	Descriptor address where EOF occurs	3FF43138	3FF42138	3FF64138	3FF64138	RO
SPI_OUTLINK_DSCR_REG	Current descriptor pointer	3FF4313C	3FF4213C	3FF6413C	3FF6413C	RO
SPI_OUTLINK_DSCR_BF0_REG	Next descriptor data pointer	3FF43140	3FF42140	3FF64140	3FF64140	RO
SPI_OUTLINK_DSCR_BF1_REG	Current descriptor data pointer	3FF43144	3FF42144	3FF64144	3FF64144	RO
SPI_DMA_RSTATUS_REG	DMA memory read status	3FF43148	3FF42148	3FF64148	3FF64148	RO
SPI_DMA_TSTATUS_REG	DMA memory write status	3FF4314C	3FF4214C	3FF6414C	3FF6414C	RO
DMA interrupt registers						
SPI_DMA_INT_RAW_REG	Raw interrupt status	3FF43114	3FF42114	3FF64114	3FF64114	RO
SPI_DMA_INT_ST_REG	Masked interrupt status	3FF43118	3FF42118	3FF64118	3FF64118	RO
SPI_DMA_INT_ENA_REG	Interrupt enable bits	3FF43110	3FF42110	3FF64110	3FF64110	R/W
SPI_DMA_INT_CLR_REG	Interrupt clear bits	3FF4311C	3FF4211C	3FF6411C	3FF6411C	R/W

SPI_USR This bit is used to enable user-defined commands. An operation will be triggered when this bit is set. The bit will be cleared once the operation is done. (R/W)

Register 7.2: SPI_ADDR_REG (0x4)

31																												0
0x00000000																												

Reset

SPI_ADDR_REG Address to slave or from master. If the address length is bigger than 32 bits, SPI_SLV_WR_STATUS_REG contains the lower 32 bits while this register contains the higher address bits. (R/W)

spi_fread_dout. 1: enable 0: disable. (R/W)

--	--

Register 7.5: SPI_RD_STATUS_REG (0x10)

SPI_STATUS_EXT																SPI_STATUS																			
31									24	23									16	15													0		
0x000								0x000								0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

SPI_STATUS_EXT In slave mode, this is the status for the master to read. (R/W)

SPI_STATUS In slave mode, this is the status for the master to read. (R/W)

SPI_CS_DELAY_NUM The spi_cs signal is delayed by the number of system clock cycles configured here. (R/W)

SPI_CS_DELAY_MODE This register field determines the way the spi_cs signal is delayed by spi_clk. (R/W)

0: none.

1: if SPI_CLK_OUT_EDGE or SPI_CLK_I_EDGE is set, spi_cs is delayed by half a cycle, otherwise it is delayed by one cycle.

2: if SPI_CLK_OUT_EDGE or SPI_CLK_I_EDGE is set, spi_cs is delayed by one cycle, otherwise it is delayed by half a cycle.

3: the spi_cs signal is delayed by one cycle.

SPI_MOSI_DELAY_NUM The MOSI signals are delayed by the number of system clock cycles configured here. (R/W)

SPI_MOSI_DELAY_MODE This register field determines the way the MOSI signals are delayed by spi_clk. (R/W)

0: none.

1: if SPI_CLK_OUT_EDGE or SPI_CLK_I_EDGE is set, the MOSI signals are delayed by half a cycle, otherwise they are delayed by one cycle.

2: if SPI_CLK_OUT_EDGE or SPI_CLK_I_EDGE is set, the MOSI signals are delayed by one cycle, otherwise they are delayed by half a cycle.

3: the MOSI signals are delayed one cycle.

SPI_MISO_DELAY_NUM The MISO signals are delayed by the number of system clock cycles specified here. (R/W)

SPI_MISO_DELAY_MODE This register field determines the way MISO signals are delayed by spi_clk. (R/W)

0: none.

1: if SPI_CLK_OUT_EDGE or SPI_CLK_I_EDGE is set, the MISO signals are delayed by half a cycle, otherwise they are delayed by one cycle.

2: if SPI_CLK_OUT_EDGE or SPI_CLK_I_EDGE is set, the MISO signals are delayed by one cycle, otherwise they are delayed by half a cycle.

3: the MISO signals are delayed by one cycle.

SPI_HOLD_TIME The number of spi_clk cycles by which CS pin signals are delayed. These bits are used in conjunction with the SPI_CS_HOLD bit. (R/W)

SPI_SETUP_TIME The number of spi_clk cycles for which spi_cs is made active before the SPI data transaction starts. This register field is used when SPI_CS_SETUP is set. (R/W)

SPI_CLK_EQU_SYSCLK																SPI_CLKDIV_PRE																SPI_CLKONT_N																SPI_CLKONT_H																SPI_CLKONT_L															
31																18	17																12	11																6	5																0												
1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0x03																0x01																0x03																														

Reset

SPI_CLKCNT_L In master mode, this must be equal to SPI_CLKCNT_N. In slave mode this must be 0. (R/W)

Register 7.8: SPI_USER_REG (0x1C)

SPI_USR_COMMAND																							SPI_USR_ADDR																							SPI_USR_DUMMY																							SPI_USR_MISO																							SPI_USR_MOSI																							SPI_USR_DUMMY_IDLE																							SPI_USR_MOSI_HIGHPART																							SPI_USR_MISO_HIGHPART																							(reserved)																							SPI_SIO																							SPI_FWRITE_QIO																							SPI_FWRITE_DIO																							SPI_FWRITE_QUAD																							SPI_WR_BYTE_ORDER																							(reserved)																							SPI_CK_OUT_EDGE																							SPI_CK_I_EDGE																							SPI_CS_SETUP																							SPI_CS_HOLD																							(reserved)																							SPI_DOUTDIN

Reset

SPI_USR_COMMAND This bit enables the command phase of an operation. (R/W)

SPI_USR_ADDR This bit enables the address phase of an operation. (R/W)

SPI_USR_DUMMY This bit enables the dummy phase of an operation. (R/W)

SPI_USR_MISO This bit enables the read-data phase of an operation. (R/W)

SPI_USR_MOSI This bit enables the write-data phase of an operation. (R/W)

SPI_USR_DUMMY_IDLE The spi_clk signal is disabled in the dummy phase when the bit is set. (R/W)

SPI_USR_MOSI_HIGHPART If set, data written to the device is only read from SPI_W8-SPI_W15 of the SPI buffer. (R/W)

SPI_USR_MISO_HIGHPART If set, data read from the device is only written to SPI_W8-SPI_W15 of the SPI buffer. (R/W)

SPI_SIO Set this bit to enable three-line half-duplex communication where MOSI and MISO signals share the same pin. (R/W)

SPI_FWRITE_QIO This bit enables the use of four data lines for address and MISO data writes. 1: enable; 0: disable. (R/W)

SPI_FWRITE_DIO This bit enables the use of two data lines for address and MISO data writes. 1: enable; 0: disable. (R/W)

SPI_FWRITE_QUAD This bit enables the use of four data lines for MISO data writes. 1: enable; 0: disable. (R/W)

SPI_FWRITE_DUAL This bit determines whether to use two data lines for MISO data writes or not. 1: enable; 0: disable. (R/W)

SPI_WR_BYTE_ORDER This bit determines the byte-endianness for writing command, address, and MOSI data. 1: big-endian; 0: little-endian. (R/W)

SPI_RD_BYTE_ORDER This bit determines the byte-endianness for reading MISO data. 1: big-endian; 0: little-endian. (R/W)

SPI_CK_OUT_EDGE This bit, combined with SPI_MOSI_DELAY_MODE, sets the MOSI signal delay mode. (R/W)

SPI_CK_I_EDGE In slave mode, the bit is the same as SPI_CK_OUT_EDGE in master mode. It is combined with SPI_MISO_DELAY_MODE. (R/W)

SPI_CS_SETUP Setting this bit enables a delay between spi_cs being active and starting data transfer, as specified in SPI_SETUP_TIME. This bit only is valid in half-duplex mode, that is, when SPI_DOUTDIN is not set. (R/W)

SPI_CS_HOLD Setting this bit enables a delay between the end of a transmission and spi_cs being made inactive, as specified in SPI_HOLD_TIME. (R/W)

SPI_DOUTDIN Set the bit to enable full-duplex communication, meaning that MOSI data is sent out at the same time MISO data is received. 1: enable; 0: disable. (R/W)

Register 7.9: SPI_USER1_REG (0x20)

SPI_USR_ADDR_BITLEN The bit length of the address phase minus one. (RO)

SPI_USR_DUMMY_CYCLELEN The number of spi_clk cycles for the dummy phase, minus one. (R/W)

Register 7.10: SPI_USER2_REG (0x24)

SPI_USR_COMMAND_BITLEN The bit length of the command phase minus one. (R/W)

SPI_USR_COMMAND_VALUE The value of the command. (R/W)

Register 7.11: SPI_MOSI_DLEN_REG (0x28)

SPI_USR_MOSI_DBITLEN The bit length of the data to be written to the device minus one. (R/W)

Register 7.12: SPI_MISO_DLEN_REG (0x2C)

SPI_USR_MISO_DBITLEN The bit length of the data to be read from the device, minus one. (R/W)

Register 7.13: SPI_SLV_WR_STATUS_REG (0x30)

SPI_SLV_WR_STATUS_REG In the slave mode this register is the status register for the master to write into. In the master mode, if the address length is bigger than 32 bits, this register contains the lower 32 bits. (R/W)

Register 7.14: SPI_PIN_REG (0x34)

(reserved)				(reserved)														SPI_MASTER_CK_SEL				(reserved)				SPI_MASTER_CS_POL		SPI_CK_DIS		(reserved)		SPI_CS2_DIS		SPI_CS1_DIS		SPI_CS0_DIS	
31	30	29	28															14	13	11	10	9	8	6	5	4	3	2	1	0							
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	Reset					

Reset

SPI_CS_KEEP_ACTIVE When set, the spi_cs will be kept active even when not in a data transaction. (R/W)

SPI_CK_IDLE_EDGE The idle state of the spi_clk line. (R/W)
 1: the spi_clk line is high when idle;
 0: the spi_clk line is low when idle.

SPI_MASTER_CK_SEL This register field contains one bit per spi_cs line. When a bit is set in master mode, the corresponding spi_cs line is made active and the spi_cs pin outputs spi_clk. (R/W)

SPI_MASTER_CS_POL This register field selects the polarity of the spi_cs line. It contains one bit per spi_cs line. Possible values of the bits: (R/W)
 0: spi_cs is active-low;
 1: spi_cs is active-high.

SPI_CK_DIS When set, output of the spi_clk signal is disabled. (R/W)

SPI_CS2_DIS This bit enables the SPI CS2 pin. 1: disables CS2; 0: spi_cs2 is active during the data transaction. (R/W)

SPI_CS1_DIS This bit enables the SPI CS1 pin. 1: disables CS1; 0: spi_cs1 is active during the data transaction (R/W)

SPI_CS0_DIS This bit enables the SPI CS0 pin. 1: disables CS0; 0: spi_cs0 is active during the data transaction. (R/W)

SPI_SYNC_RESET This bit is used to enable software reset. When set, it resets the latched values of the SPI clock line, cs line and data lines. (R/W)

SPI_SLAVE_MODE This bit is used to set the mode of the SPI device. (R/W)

```
1: slave mode;
```

0: master mode.

SPI_SLV_WR_RD_BUF_EN Setting this bit enables the write and read buffer commands in slave mode. (R/W)

SPI_SLV_WR_RD_STA_EN Setting this bit enables the write and read status commands in slave mode. (R/W)

SPI_SLV_CMD_DEFINE This bit is used to enable custom slave mode commands. (R/W)

1: slave mode commands are defined in SPI_SLAVE3.

0: slave mode commands are fixed as: 0x1: write-status; 0x2: write-buffer, 0x3: read-buffer; and 0x4: read-status.

SPI_TRANS_CNT The counter for operations in both the master mode and the slave mode. (RO)

SPI_SLV_LAST_STATE In slave mode, this contains the state of the SPI state machine. (RO)

SPI_SLV_LAST_COMMAND In slave mode, this contains the value of the received command. (RO)

SPI_CS_I_MODE In the slave mode, this selects the mode to synchronize the input SPI cs signal and eliminate SPI cs jitter. (R/W)

0: configured through registers (SPI_CS_DELAY_NUM and SPI_CS_DELAY_MODE);

1: using double synchronization method and configured through registers (SPI_CS_DELAY_NUM and SPI_CS_DELAY_MODE);

2: using double synchronization method.

SPI_TRANS_INTEN The interrupt enable bit for the [SPI_TRANS_DONE_INT](#) interrupt. (R/W)

SPI_SLV_WR_STA_INTEN The interrupt enable bit for the [SPI_SLV_WR_STA_INT](#) interrupt. (R/W)

SPI_SLV_RD_STA_INTEN The interrupt enable bit for the [SPI_SLV_RD_STA_INT](#) interrupt. (R/W)

SPI_SLV_WR_BUF_INTEN The interrupt enable bit for the [SPI_SLV_WR_BUF_INT](#) interrupt. (R/W)

SPI_SLV_RD_BUF_INTEN The interrupt enable bit for the [SPI_SLV_RD_BUF_INT](#) interrupt. (R/W)

SPI_TRANS_DONE The raw interrupt status bit for the [SPI_TRANS_DONE_INT](#) interrupt. (R/W)

SPI_SLV_WR_STA_DONE The raw interrupt status bit for the [SPI_SLV_WR_STA_INT](#) interrupt. (R/W)

SPI_SLV_RD_STA_DONE The raw interrupt status bit for the [SPI_SLV_RD_STA_INT](#) interrupt. (R/W)

SPI_SLV_WR_BUF_DONE The raw interrupt status bit for the [SPI_SLV_WR_BUF_INT](#) interrupt. (R/W)

SPI_SLV_RD_BUF_DONE The raw interrupt status bit for the [SPI_SLV_RD_BUF_INT](#) interrupt. (R/W)

Register 7.16: SPI_SLAVE1_REG (0x3C)

31					27					26	25	24										16					15					10					9					4					3	2	1	0	
0					0					0	1	0										0					0x00					0x00					0					0	0	0	0	Reset					

SPI_SLV_STATUS_BITLEN In slave mode, this sets the length of the status field. (R/W)

SPI_SLV_STATUS_FAST_EN In slave mode, this enables fast reads of the status. (R/W)

SPI_SLV_STATUS_READBACK In slave mode, this selects the active status register. (R/W)

1: reads register of SPI_SLV_WR_STATUS;

0: reads register of SPI_RD_STATUS.

SPI_SLV_RD_ADDR_BITLEN In slave mode, this contains the address length in bits for a read-buffer operation, minus one. (R/W)

SPI_SLV_WR_ADDR_BITLEN In slave mode, this contains the address length in bits for a write-buffer operation, minus one. (R/W)

SPI_SLV_WRSTA_DUMMY_EN In slave mode, this bit enables the dummy phase for write-status operations. (R/W)

SPI_SLV_RDSTA_DUMMY_EN In slave mode, this bit enables the dummy phase for read-status operations. (R/W)

SPI_SLV_WRBUF_DUMMY_EN In slave mode, this bit enables the dummy phase for write-buffer operations. (R/W)

SPI_SLV_RDBUF_DUMMY_EN In slave mode, this bit enables the dummy phase for read-buffer operations. (R/W)

Register 7.17: SPI_SLAVE2_REG (0x40)

SPI_SLV_WRBUF_DUMMY_CYCLELEN								SPI_SLV_RDBUF_DUMMY_CYCLELEN								SPI_SLV_WRSTA_DUMMY_CYCLELEN								SPI_SLV_RDSTA_DUMMY_CYCLELEN

Reset

SPI_SLV_WRSTA_CMD_VALUE In slave mode, this contains the value of the write-status command. (R/W)

SPI_SLV_RDSTA_CMD_VALUE In slave mode, this contains the value of the read-status command. (R/W)

SPI_SLV_WRBUF_CMD_VALUE In slave mode, this contains the value of the write-buffer command. (R/W)

SPI_SLV_RDBUF_CMD_VALUE In slave mode, this contains the value of the read-buffer command. (R/W)

Register 7.19: SPI_SLV_WRBUFF_DLEN_REG (0x48)

(reserved)								SPI_SLV_WRBUFF_DBITLEN																								
31								24	23																						0	
0	0	0	0	0	0	0	0	0	0x0000000																							Reset

SPI_SLV_WRBUFF_DBITLEN This equals to the bit length of data written into the slave buffer, minus one. (R/W)

Register 7.20: SPI_SLV_RDBUF_DLEN_REG (0x4C)

(reserved)								SPI_SLV_RDBUF_DBITLEN																								
31								24	23																					0		
0	0	0	0	0	0	0	0	0	0x0000000																							Reset

SPI_SLV_RDBUF_DBITLEN This equals to the bit length of data read from the slave buffer, minus one. (R/W)

Register 7.21: SPI_SLV_RD_BIT_REG (0x64)

(reserved)								SPI_SLV_RDATA_BIT																							
31								24	0																						
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

SPI_SLV_RDATA_BIT This equals to the bit length of data the master reads from the slave, minus one. (R/W)

Register 7.22: SPI_W n _REG (n : 0-15) (0x80+4* n)

31																															0			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

SPI_W n _REG Data buffer. (R/W)

Register 7.23: SPI_TX_CRC_REG (0xC0)

31	0
0 0	Reset

SPI_TX_CRC_REG For SPI1, this contains the CRC32 value of 256 bits of data. (R/W)

Register 7.24: SPI_EXT2_REG (0xF8)

31	(reserved)	3	2	0
0 0				0 0 0 0
				Reset

SPI_ST The current state of the SPI state machine: (RO)

- 0: idle state
- 1: preparation state
- 2: send command state
- 3: send data state
- 4: read data state
- 5: write data state
- 6: wait state
- 7: done state

Reset

SPI_INLINK_RESTART Set the bit to add new inlink descriptors. (R/W)

SPI_INLINK_START Set the bit to start to use inlink descriptor. (R/W)

SPI_INLINK_STOP Set the bit to stop to use inlink descriptor. (R/W)

SPI_INLINK_AUTO_RET when the bit is set, inlink descriptor jumps to the next descriptor when a packet is invalid. (R/W)

SPI_INLINK_ADDR The address of the first inlink descriptor. (R/W)

RX_FIFO_FULL The SPI DMA Rx FIFO is full. (RO)

RX_DES_ADDRESS The LSB of the SPI DMA inlink descriptor address. (RO)

8. SDIO Slave

8.1 Overview

The ESP32 features hardware support for the industry-standard Secure Digital (SD) device interface that conforms to the SD Input/Output (SDIO) Specification Version 2.0. This allows a host controller to access the ESP32 via an SDIO bus protocol, enabling high-speed data transfer.

The SDIO interface may be used to read ESP32 SDIO registers directly and access shared memory via Direct Memory Access (DMA), thus reducing processing overhead while maintaining high performance.

8.2 Features

- Meets SDIO V2.0 specification
- Supports SDIO SPI, 1-bit, and 4-bit transfer modes
- Full host clock range of 0 ~ 50 MHz
- Configurable sample and drive clock edge
- Integrated, SDIO-accessible registers for information interaction
- Supports SDIO interrupt mechanism
- Automatic data padding
- Block size of up to 512 bytes
- Interrupt vector between Host and Slave for bidirectional interrupt
- Supports DMA for data transfer

8.3 Functional Description

8.3.1 SDIO Slave Block Diagram

The functional block diagram of the SDIO slave module is shown in Figure 20.

Figure 20: SDIO Slave Block Diagram

The Host System represents any SDIO specification V2.0-compatible host device. The Host System interacts with the ESP32 (configured as the SDIO slave) via the standard SDIO bus implementation.

The SDIO Device Interface block enables effective communication with the external Host by directly providing SDIO interface registers and enabling DMA operation for high-speed data transfer over the Advanced High-performance Bus (AHB) without engaging the CPU.

8.3.2 Sending and Receiving Data on SDIO Bus

Data is transmitted between Host and Slave through the SDIO bus I/O Function1. After the Host enables the I/O Function1 in the Slave, according to the SDIO protocol, data transmission will begin.

ESP32 segregates data into packets sent to/from the Host. To achieve high bus utilization and data transfer rates, we recommend the single block transmission mode. For detailed information on this mode, please refer to the SDIO V2.0 protocol specification. When Host and Slave exchange data as blocks on the SDIO bus, the Slave automatically pads data-when sending data out-and automatically strips padding data from the incoming data block.

Whether the Slave pads or discards the data depends on the data address on the SDIO bus. When the data address is equal to, or greater than, 0x1F800, the Slave will start padding or discarding data. Therefore, the starting data address should be $0x1F800 - \text{Packet_length}$, where Packet_length is measured in bytes. Data flow on the SDIO bus is shown in Figure 21.

Figure 21: SDIO Bus Packet Transmission

The standard IO_RW_EXTENDED (CMD53) command is used to initiate a packet transfer of an arbitrary length. The content of the CMD53 command used in data transmission is as illustrated in Figure 22 below. For detailed information on CMD53, please refer to the SDIO protocol specifications.

S	D	Command Index 11010b	R/W Flag	Function Number 001b	Block Mode 1b	OP Code 1b	Register Address 0x1F800-Packet_length	CRC7	E
1	1	6	1	3	1	1	17	7	1

Figure 22: CMD53 Content

8.3.3 Register Access

For effective interaction between Host and Slave, the Host can access certain registers in the Slave via the SDIO bus I/O Function1. These registers are in continuous address fields from SLCHOST_TOKEN_RDATA to SLCHOST_INF_ST. The Host device can access these registers by simply setting the register addresses of CMD52 or CMD53 to the low 10 bits of the corresponding register address. The Host can access several consecutive registers at one go with CMD53, thus achieving a higher effective transfer rate.

There are 54 bytes of field between SLCHOST_CONF_W0_REG and SLCHOST_CONF_W15_REG. Host and Slave can access and change these fields, thus facilitating the information interaction between Host and Slave.

8.3.4 DMA

The SDIO Slave module uses dedicated DMA to access data residing in the RAM. As shown in Figure 20, the RAM is accessed over the AHB. DMA accesses RAM through a linked-list descriptor. Every linked list is composed of three words, as shown in Figure 23.

Figure 23: SDIO Slave DMA Linked List Structure

- Owner: The allowed operator of the buffer that corresponds to the current linked list. 0: CPU is the allowed operator; 1: DMA is the allowed operator.
- Eof: End-of-file marker, indicating that this linked-list element is the last element of the data packet.
- Length: The number of valid bytes in the buffer, i.e., the number of bytes that should be accessed from the buffer for reading/writing.
- Size: The maximum number of available buffers.
- Buffer Address Pointer: The address of the data buffer as seen by the CPU (according to the RAM address space).
- Next Descriptor Address: The address of the next linked-list element in the CPU RAM address space. If the current linked list is the last one, the Eof bit should be 1, and the last descriptor address should be 0.

The Slave's linked-list chain is shown in Figure 24:

Figure 24: SDIO Slave Linked List

8.3.5 Packet-Sending/-Receiving Procedure

The SDIO Host and Slave devices need to follow specific data transfer procedures to successfully exchange data over the SDIO interface.

8.3.5.1 Sending Packets to SDIO Host

The transmission of packets from Slave to Host is initiated by the Slave. The Host will be notified with an interrupt (for detailed information on interrupts, please refer to SDIO protocol). After the Host reads the relevant information from the Slave, it will initiate an SDIO bus transaction accordingly. The whole procedure is illustrated in Figure 25.

Figure 25: Packet Sending Procedure (Initiated by Slave)

When the Host is interrupted, it reads relevant information from the Slave by visiting registers SLC0HOST_INT and SLCHOST_PKT_LEN.

- SLC0HOST_INT: Interrupt status register. If the value of SLC0_RX_NEW_PACKET_INT_ST is 1, this indicates that the Slave has a packet to send.
- SLCHOST_PKT_LEN: Packet length accumulator register. The current value minus the value of last time equals the packet length sent this time.

In order to start DMA, the CPU needs to write the low 20 bits of the address of the first linked-list element to the SLC0_RXLINK_ADDR bit of SLC0RX_LINK, then set the SLC0_RXLINK_START bit of SLC0RX_LINK. The DMA will automatically complete the data transfer. Upon completion of the operation, DMA will interrupt the CPU so that the buffer space can be freed or reused.

8.3.5.2 Receiving Packets from SDIO Host

Transmission of packets from Host to Slave is initiated by the Host. The Slave receives data via DMA and stores it in RAM. After transmission is completed, the CPU will be interrupted to process the data. The whole procedure is demonstrated in Figure 26.

Figure 26: Packet Receiving Procedure (Initiated by Host)

The Host obtains the number of available receiving buffers from the Slave by accessing register SLC0HOST_TOKEN_RDATA. The Slave CPU should update this value after the receiving DMA linked list is prepared.

HOSTREG_SLC0_TOKEN1 in SLC0HOST_TOKEN_RDATA stores the accumulated number of available buffers.

The Host can figure out the available buffer space, using HOSTREG_SLC0_TOKEN1 minus the number of buffers already used.

If the buffers are not enough, the Host needs to constantly poll the register until there are enough buffers available.

To ensure sufficient receiving buffers, the Slave CPU must constantly load buffers on the receiving linked list. The process is shown in Figure 27.

Figure 27: Loading Receiving Buffer

The CPU first needs to append new buffer segments at the end of the linked list that is being used by DMA and is available for receiving data.

The CPU then needs to notify the DMA that the linked list has been modified. This can be done by setting bit SLC0_TXLINK_RESTART of the SLC0TX_LINK register. Please note that when the CPU initiates DMA to receive packets for the first time, SLC0_TXLINK_RESTART should be set to 1.

Lastly, the CPU refreshes any available buffer information by writing to the SLC0TOKEN1 register.

8.3.6 SDIO Bus Timing

The SDIO bus operates at a very high speed and the PCB trace length usually affects signal integrity by introducing latency. To ensure that the timing characteristics conform to the desired bus timing, the SDIO Slave module supports configuration of input sampling clock edge and output driving clock edge.

When the incoming data changes near the rising edge of the clock, the Slave will perform sampling on the falling edge of the clock, or vice versa, as Figure 28 shows.

Figure 28: Sampling Timing Diagram

Sampling edges are configured via the FRC_POS_SAMP and FRC_NEG_SAMP bitfields in the SLCHOST_CONF register. Each field is five bits wide, with bits corresponding to the CMD line and four DATA lines (0-3). Setting a bit in FRC_POS_SAMP causes the corresponding line to be sampled for input at the rising clock edge, whereas setting a bit in FRC_NEG_SAMP causes the corresponding line to be sampled for input at the falling clock edge.

The Slave can also select the edge at which data output lines are driven to accommodate for any latency caused by the physical signal path, as shown in Figure 29.

Figure 29: Output Timing Diagram

Driving edges are configured via the FRC_SDIO20 and FRC_SDIO11 bitfields in the SLCHOST_CONF register. Each field is five bits wide, with bits corresponding to the CMD line and four DATA lines (0-3). Setting a bit in FRC_SDIO20 causes the corresponding line to output at the rising clock edge, whereas setting a bit in FRC_SDIO11 causes the corresponding line to output at the falling clock edge.

8.3.7 Interrupt

Host and Slave can interrupt each other via the interrupt vector. Both Host and Slave have eight interrupt vectors. The interrupt is enabled by configuring the interrupt vector register (setting the enable bit to 1). The interrupt vector registers can clear themselves automatically, which means one interrupt at a time and no other configuration is required.

8.3.7.1 Host Interrupt

- `SLC0HOST_SLC0_RX_NEW_PACKET_INT` Slave has a packet to send.
- `SLC0HOST_SLC0_TX_OVF_INT` Slave receiving buffer overflow interrupt.
- `SLC0HOST_SLC0_RX_UDF_INT` Slave sending buffer underflow interrupt.
- `SLC0HOST_SLC0_TOHOST_BITn_INT` (n : 0 ~ 7) Slave interrupts Host.

8.3.7.2 Slave Interrupt

- `SLC0INT_SLC0_RX_DSCR_ERR_INT` Slave sending descriptor error.
- `SLC0INT_SLC0_TX_DSCR_ERR_INT` Slave receiving descriptor error.
- `SLC0INT_SLC0_RX_EOF_INT` Slave sending operation is finished.
- `SLC0INT_SLC0_RX_DONE_INT` A single buffer is sent by Slave.
- `SLC0INT_SLC0_TX_SUC_EOF_INT` Slave receiving operation is finished.
- `SLC0INT_SLC0_TX_DONE_INT` A single buffer is finished during receiving operation.
- `SLC0INT_SLC0_TX_OVF_INT` Slave receiving buffer overflow interrupt.
- `SLC0INT_SLC0_RX_UDF_INT` Slave sending buffer underflow interrupt.
- `SLC0INT_SLC0_TX_START_INT` Slave receiving interrupt initialization.
- `SLC0INT_SLC0_RX_START_INT` Slave sending interrupt initialization.

- `SLC0INT_SLC_FRHOST_BITn_INT` (n : 0 ~ 7) Host interrupts Slave.

8.4 Register Summary

Name	Description	Address	Access
SDIO DMA (SLC) configuration registers			
<code>SLCCONF0_REG</code>	SLCCONF0_SLC configuration	0x3FF58000	R/W
<code>SLC0INT_RAW_REG</code>	Raw interrupt status	0x3FF58004	RO
<code>SLC0INT_ST_REG</code>	Interrupt status	0x3FF58008	RO
<code>SLC0INT_ENA_REG</code>	Interrupt enable	0x3FF5800C	R/W
<code>SLC0INT_CLR_REG</code>	Interrupt clear	0x3FF58010	WO
<code>SLC0RX_LINK_REG</code>	Transmitting linked list configuration	0x3FF5803C	R/W
<code>SLC0TX_LINK_REG</code>	Receiving linked list configuration	0x3FF58040	R/W
<code>SLCINTVEC_TOHOST_REG</code>	Interrupt sector for Slave to interrupt Host	0x3FF5804C	WO
<code>SLC0TOKEN1_REG</code>	Number of receiving buffer	0x3FF58054	WO
<code>SLCCONF1_REG</code>	Control register	0x3FF58060	R/W
<code>SLC_RX_DSCR_CONF_REG</code>	DMA transmission configuration	0x3FF58098	R/W
<code>SLC0_LEN_CONF_REG</code>	Length control of the transmitting packets	0x3FF580E4	R/W
<code>SLC0_LENGTH_REG</code>	Length of the transmitting packets	0x3FF580E8	R/W

Name	Description	Address	Access
SDIO SLC Host registers			
<code>SLC0HOST_INT_RAW_REG</code>	Raw interrupt	0x3FF55000	RO

<code>SLC0HOST_FUNC1_INT_ENA_REG</code>	Interrupt enable	0x3FF550DC	R/W

SLCHOST_CONF_REG	Edge configuration	0x3FF551F0	R/W
----------------------------------	--------------------	------------	-----

Name	Description	Address	Access
SDIO HINF registers			
HINF_CFG_DATA1_REG	SDIO specification configuration	0x3FF4B004	R/W

8.5 SLC Registers

The first block of SDIO control registers starts at 0x3FF5_8000.

Register 8.1: SLCCONF0_REG (0x0)

SLCCONF0_SLC0_TOKEN_AUTO_CLR Please initialize to 0. Do not modify it. (R/W)

SLCCONF0_SLC0_RX_AUTO_WRBCK Allows changing the owner bit of the transmitting buffer's linked list when transmitting data. (R/W)

SLCCONF0_SLC0_RX_LOOP_TEST Loop around when the slave buffer finishes sending packets. When set to 1, hardware will not change the owner bit in the linked list. (R/W)

SLCCONF0_SLC0_TX_LOOP_TEST Loop around when the slave buffer finishes receiving packets. When set to 1, hardware will not change the owner bit in the linked list. (R/W)

SLCCONF0_SLC0_RX_RST Set this bit to reset the transmitting FSM. (R/W)

SLCCONF0_SLC0_TX_RST Set this bit to reset the receiving FSM. (R/W)

162

ESP32 Technical Reference Manual V3.1

SLC0INT_SLC_FRHOST_BIT0_INT_RAW The interrupt mark bit 0 for Host to interrupt Slave. (RO)

Register 8.3: SLC0INT_ST_REG (0x8)

[illegible]

SLC0INT_SLC0_RX_DSCR_ERR_INT_ST The interrupt status bit for Slave sending descriptor error.
(RO)

SLC0INT_SLC0_TX_DSCR_ERR_INT_ST The interrupt status bit for Slave receiving descriptor error.
(RO)

SLC0INT_SLC0_RX_EOF_INT_ST The interrupt status bit for finished Slave sending operation. (RO)

SLC0INT_SLC0_RX_DONE_INT_ST The interrupt status bit for finished Slave sending operation.
(RO)

SLC0INT_SLC0_TX_SUC_EOF_INT_ST The interrupt status bit for marking Slave receiving operation as finished. (RO)

SLC0INT_SLC0_TX_DONE_INT_ST The interrupt status bit for marking a single buffer as finished during the receiving operation. (RO)

SLC0INT_SLC0_TX_OVF_INT_ST The interrupt status bit for Slave receiving overflow interrupt. (RO)

SLC0INT SLC0 RX UDF INT ST The interrupt status bit for Slave sending buffer underflow. (RO)

SLC0INT_SLC0_TX_START_INT_ST The interrupt status bit for Slave receiving interrupt initialization.
(RO)

SLC0INT_SLC0_RX_START_INT_ST (RO)	The interrupt status bit for Slave sending interrupt initialization.
---	--

SLC0INT_SLC_FRHOST_BIT7_INT_ST The interrupt status bit 7 for Host to interrupt Slave. (RO)

SLC0INT_SLC_FRHOST_BIT6_INT_ST The interrupt status bit 6 for Host to interrupt Slave. (RO)

SLC0INT_SLC_FRHOST_BIT5_INT_ST The interrupt status bit 5 for Host to interrupt Slave. (RO)

SLC0INT	SLC	FRHOST	BIT4	INT	ST	The interrupt status bit 4 for Host to interrupt Slave. (RO)
----------------	------------	---------------	-------------	------------	-----------	--

SLC0INT_SLC_FRHOST_BIT3_INT_ST The interrupt status bit 3 for Host to interrupt Slave. (RO)

SLC0INT_SLC_FRHOST_BIT2_INT_ST The interrupt status bit 2 for Host to interrupt Slave. (RO)

SLC0INT_SLC_FRHOST_BIT1_INT_ST The interrupt status bit 1 for Host to interrupt Slave. (RO)

SLC0INT	SLC	FRHOST	BIT0	INT	ST	The interrupt status bit 0 for Host to interrupt Slave. (RO)
----------------	------------	---------------	-------------	------------	-----------	--

Register 8.4: SLC0INT_ENA_REG (0xC)

[illegible]

SLC0INT_SLC0_RX_DSCR_ERR_INT_ENA The interrupt enable bit for Slave sending linked list descriptor error. (R/W)

SLC0INT_SLC0_TX_DSCR_ERR_INT_ENA The interrupt enable bit for Slave receiving linked list descriptor error. (R/W)

SLC0INT_SLC0_RX_EOF_INT_ENA The interrupt enable bit for Slave sending operation completion.
(R/W)

SLC0INT_SLC0_RX_DONE_INT_ENA The interrupt enable bit for single buffer's sent interrupt, in Slave sending mode. (R/W)

SLC0INT_SLC0_TX_SUC_EOF_INT_ENA The interrupt enable bit for Slave receiving operation completion. (R/W)

SLC0INT_SLC0_TX_DONE_INT_ENA The interrupt enable bit for single buffer's full event, in Slave receiving mode. (R/W)

SLC0INT_SLC0_TX_OVF_INT_ENA The interrupt enable bit for Slave receiving buffer overflow. (R/W)

SLC0INT_SLC0_RX_UDF_INT_ENA The interrupt enable bit for Slave sending buffer underflow.
(R/W)

SLC0INT_SLC0_TX_START_INT_ENA The interrupt enable bit for Slave receiving operation initialization. (R/W)

SLC0INT_SLC0_RX_START_INT_ENA The interrupt enable bit for Slave sending operation initialization. (R/W)

SLC0INT SLC FRHOST BIT7 INT ENA The interrupt enable bit 7 for Host to interrupt Slave. (R/W)

SLC0INT_SLC_FRHOST_BIT6_INT_ENA The interrupt enable bit 6 for Host to interrupt Slave. (R/W)

SLC0INT SLC FRHOST BIT5 INT ENA The interrupt enable bit 5 for Host to interrupt Slave. (R/W)

SLC0INT SLC FRHOST BIT4 INT ENA The interrupt enable bit 4 for Host to interrupt Slave. (R/W)

SLC0INT_SLC_FRHOST_BIT3_INT_ENA The interrupt enable bit 3 for Host to interrupt Slave. (R/W)

SLC0INT_SLC_FRHOST_BIT2_INT_ENA The interrupt enable bit 2 for Host to interrupt Slave. (R/W)

SLC0INT SLC FRHOST BIT1 INT ENA The interrupt enable bit 1 for Host to interrupt Slave. (R/W)

SLC0INT_SLC_FRHOST_BIT0_INT_ENA The interrupt enable bit 0 for Host to interrupt Slave. (R/W)

Register 8.5: SLC0INT_CLR_REG (0x10)

[illegible]

SLC0INT_SLC0_RX_DSCR_ERR_INT_CLR Interrupt clear bit for Slave sending linked list descriptor error. (WO)

SLC0INT_SLC0_TX_DSCR_ERR_INT_CLR Interrupt clear bit for Slave receiving linked list descriptor error. (WO)

SLC0INT_SLC0_RX_EOF_INT_CLR Interrupt clear bit for Slave sending operation completion. (WO)

SLC0INT_SLC0_RX_DONE_INT_CLR Interrupt clear bit for single buffer's sent interrupt, in Slave sending mode. (WO)

SLC0INT_SLC0_TX_SUC_EOF_INT_CLR Interrupt clear bit for Slave receiving operation completion. (WO)

SLC0INT_SLC0_TX_DONE_INT_CLR Interrupt clear bit for single buffer's full event, in Slave receiving mode. (WO)

SLC0INT_SLC0_TX_OVF_INT_CLR Set this bit to clear the Slave receiving overflow interrupt. (WO)

SLC0INT_SLC0_RX_UDF_INT_CLR Set this bit to clear the Slave sending underflow interrupt. (WO)

SLC0INT_SLC0_TX_START_INT_CLR Set this bit to clear the interrupt for Slave receiving operation initialization. (WO)

SLC0INT_SLC0_RX_START_INT_CLR Set this bit to clear the interrupt for Slave sending operation initialization. (WO)

SLC0INT_SLC_FRHOST_BIT7_INT_CLR Set this bit to clear the [SLC0INT_SLC_FRHOST_BIT7_INT](#) interrupt. (WO)

SLC0INT_SLC_FRHOST_BIT6_INT_CLR Set this bit to clear the [SLC0INT_SLC_FRHOST_BIT6_INT](#) interrupt. (WO)

SLC0INT_SLC_FRHOST_BIT5_INT_CLR Set this bit to clear the [SLC0INT_SLC_FRHOST_BIT5_INT](#) interrupt. (WO)

SLC0INT_SLC_FRHOST_BIT4_INT_CLR Set this bit to clear the [SLC0INT_SLC_FRHOST_BIT4_INT](#) interrupt. (WO)

SLC0INT_SLC_FRHOST_BIT3_INT_CLR Set this bit to clear the [SLC0INT_SLC_FRHOST_BIT3_INT](#) interrupt. (WO)

SLC0INT_SLC_FRHOST_BIT2_INT_CLR Set this bit to clear the [SLC0INT_SLC_FRHOST_BIT2_INT](#) interrupt. (WO)

SLC0INT_SLC_FRHOST_BIT1_INT_CLR Set this bit to clear the [SLC0INT_SLC_FRHOST_BIT1_INT](#) interrupt. (WO)

SLC0INT_SLC_FRHOST_BIT0_INT_CLR Set this bit to clear the [SLC0INT_SLC_FRHOST_BIT0_INT](#) interrupt. (WO)

Register 8.6: SLC0RX_LINK_REG (0x3C)

SLC0RX_SLC0_RXLINK_RESTART Set this bit to restart and continue the linked list operation for sending packets. (R/W)

SLC0RX_SLC0_RXLINK_START Set this bit to start the linked list operation for sending packets. Sending will start from the address indicated by SLC0_RXLINK_ADDR. (R/W)

SLC0RX_SLC0_RXLINK_STOP Set this bit to stop the linked list operation. (R/W)

SLC0RX_SLC0_RXLINK_ADDR The lowest 20 bits in the initial address of Slave's sending linked list. (R/W)

Register 8.7: SLC0TX_LINK_REG (0x40)

SLC0TX_SLC0_TXLINK_RESTART Set this bit to restart and continue the linked list operation for receiving packets. (R/W)

SLC0TX_SLC0_TXLINK_START Set this bit to start the linked list operation for receiving packets. Receiving will start from the address indicated by SLC0_TXLINK_ADDR. (R/W)

SLC0TX_SLC0_TXLINK_STOP Set this bit to stop the linked list operation for receiving packets. (R/W)

SLC0TX_SLC0_TXLINK_ADDR The lowest 20 bits in the initial address of Slave's receiving linked list. (R/W)

Register 8.8: SLCINTVEC_TOHOST_REG (0x4C)

(reserved)																															(reserved)																(reserved)								SLCINTVEC_SLC0_TOHOST_INTVEC																
31								24																23								16								15								8								7								0							
0x000								0 0 0 0 0 0 0 0																0x000								0x000								Reset																															

SLCINTVEC_SLC0_TOHOST_INTVEC The interrupt vector for Slave to interrupt Host. (WO)

Register 8.9: SLC0TOKEN1_REG (0x54)

(reserved)								SLC0TOKEN1_SLC0_TOKEN1								(reserved)				SLC0TOKEN1_SLC0_TOKEN1_INC_MORE								SLC0TOKEN1_SLC0_TOKEN1_WDATA							
31								28	27								16	15	14	13	12	11								0					
0x00								0x0000								0	0	0	0	0x0000								Reset							

SLC0TOKEN1_SLC0_TOKEN1 The accumulated number of buffers for receiving packets. (RO)

SLC0TOKEN1_SLC0_TOKEN1_INC_MORE Set this bit to add the value of SLC0TOKEN1_SLC0_TOKEN1_WDATA to that of SLC0TOKEN1_SLC0_TOKEN1. (WO)

SLC0TOKEN1_SLC0_TOKEN1_WDATA The number of available receiving buffers. (WO)

Register 8.10: SLCCONF1_REG (0x60)

(reserved)										(reserved)										(reserved)										SLCCONF1_SLC0_RX_STITCH_EN				SLCCONF1_SLC0_TX_STITCH_EN				SLCCONF1_SLC0_LEN_AUTO_CLR			
31											23	22											16	15											7	6	5	4			
0x000										0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	Reset										

SLCCONF1_SLC0_RX_STITCH_EN Please initialize to 0. Do not modify it. (R/W)

SLCCONF1_SLC0_TX_STITCH_EN Please initialize to 0. Do not modify it. (R/W)

SLCCONF1_SLC0_LEN_AUTO_CLR Please initialize to 0. Do not modify it. (R/W)

Register 8.11: SLC_RX_DSCR_CONF_REG (0x98)

(reserved)																														SLC_SLC0_TOKEN_NO_REPLACE			
31																														1	0		
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

SLC_SLC0_TOKEN_NO_REPLACE Please initialize to 1. Do not modify it. (R/W)

Register 8.12: SLC0_LEN_CONF_REG (0xE4)

(reserved)										(reserved)										SLC0_LEN_INC_MORE										SLC0_LEN_WDATA									
31											29	28											23	22	21	20											0		
0x0										0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0x000000										Reset			

SLC0_LEN_INC_MORE Set this bit to add the value of SLC0_LEN to that of SLC0_LEN_WDATA.
(WO)

SLC0_LEN_WDATA The packet length sent. (WO)

Register 8.13: SLC0_LENGTH_REG (0xE8)

(reserved)		SLCO_LEN	
31	20	19	0
0x0000		0x000000	
		Reset	

SLC0_LEN Indicates the packet length sent by the Slave. (RO)

8.6 SLC Host Registers

The second block of SDIO control registers starts at 0x3FF5_5000.

Register 8.14: SLC0HOST_TOKEN_RDATA (0x44)

(reserved)										HOSTREG_SLC0_TOKEN1										(reserved)																													
31										27										16										15										0									
0x000										0x000										0x000										Reset																			

HOSTREG_SLC0_TOKEN1	The accumulated number of Slave's receiving buffers. (RO)
----------------------------	---

Register 8.15: SLC0HOST_INT_RAW_REG (0x50)

[illegible]

SLC0HOST_SLC0_RX_NEW_PACKET_INT_RAW The raw interrupt status bit for the SLC0HOST SLC0 RX NEW PACKET INT interrupt. (RO)

SLC0HOST_SLC0_TX_OVF_INT_RAW The raw interrupt status bit for the [SLC0HOST_SLC0_TX_OVF_INT](#) interrupt. (RO)

SLC0HOST_SLC0_RX_UDF_INT_RAW The raw interrupt status bit for the [SLC0HOST_SLC0_RX_UDF_INT](#) interrupt. (RO)

SLC0HOST_SLC0_TOHOST_BIT7_INT_RAW The raw interrupt status bit for the SLC0HOST SLC0 TOHOST BIT7 INT interrupt. (RO)

SLC0HOST_SLC0_TOHOST_BIT6_INT_RAW The raw interrupt status bit for the [SLC0HOST_SLC0_TOHOST_BIT6_INT](#) interrupt. (RO)

SLC0HOST_SLC0_TOHOST_BIT5_INT_RAW The raw interrupt status bit for the SLC0HOST SLC0 TOHOST BIT5 INT interrupt. (RO)

SLC0HOST_SLC0_TOHOST_BIT4_INT_RAW The raw interrupt status bit for the SLC0HOST SLC0 TOHOST BIT4 INT interrupt. (RO)

SLC0HOST_SLC0_TOHOST_BIT3_INT_RAW The raw interrupt status bit for the SLC0HOST SLC0 TOHOST BIT3 INT interrupt. (RO)

SLC0HOST_SLC0_TOHOST_BIT2_INT_RAW The raw interrupt status bit for the [SLC0HOST_SLC0_TOHOST_BIT2_INT](#) interrupt. (RO)

SLC0HOST_SLC0_TOHOST_BIT1_INT_RAW The raw interrupt status bit for the SLC0HOST SLC0 TOHOST BIT1 INT interrupt. (RO)

SLC0HOST_SLC0_TOHOST_BIT0_INT_RAW The raw interrupt status bit for the [SLC0HOST_SLC0_TOHOST_BIT0_INT](#) interrupt. (RO)

171

ESP32 Technical Reference Manual V3.1

SLC0HOST_SLC0_TOHOST_BIT0_INT_ST The masked interrupt status bit for the SLC0HOST SLC0 TOHOST BIT0 INT interrupt. (RO)

Register 8.17: SLCHOST_PKT_LEN_REG (0x60)

SLCHOST_HOSTREG_SLC0_LEN_CHECK															
SLCHOST_HOSTREG_SLC0_LEN															
31															0
0x000															
Reset															

SLCHOST_HOSTREG_SLC0_LEN_CHECK Its value is HOSTREG_SLC0_LEN[9:0] plus HOSTREG_SLC0_LEN[19:10]. (RO)

SLCHOST_HOSTREG_SLC0_LEN The accumulated value of the data length sent by the Slave. The value gets updated only when the Host reads it.

Register 8.18: SLCHOST_CONF_W0_REG (0x6C)

SLCHOST_CONF3																																																															
SLCHOST_CONF2

9. SD/MMC Host Controller

9.1 Overview

The ESP32 memory card interface controller provides a hardware interface between the Advanced Peripheral Bus (APB) and an external memory device. The memory card interface allows the ESP32 to be connected to SDIO memory cards, MMC cards and devices with a CE-ATA interface. It supports two external cards (Card0 and Card1).

9.2 Features

This module has the following features:

- Two external cards
- Supports SD Memory Card standard: versions 3.0 and 3.01
- Supports MMC: versions 4.41, 4.5, and 4.51
- Supports CE-ATA: version 1.1
- Supports 1-bit, 4-bit, and 8-bit (Card0 only) modes

The SD/MMC controller topology is shown in Figure 30. The controller supports two peripherals which cannot be functional at the same time.

Figure 30: SD/MMC Controller Topology

9.3 SD/MMC External Interface Signals

The primary external interface signals, which enable the SD/MMC controller to communicate with an external device, are clock (clk), command (cmd) and data signals. Additional signals include the card interrupt, card detect, and write-protect signals. The direction of each signal is shown in Figure 31. The direction and description of each pin are listed in Table 33.

Figure 31: SD/MMC Controller External Interface Signals

Table 33: SD/MMC Signal Description

Pin	Direction	Description
cclk_out	Output	Clock signals for slave device
ccmd	Duplex	Duplex command/response lines
cdata	Duplex	Duplex data read/write lines
card_detect_n	Input	Card detection input line
card_write_prt	Input	Card write protection status input

9.4 Functional Description

9.4.1 SD/MMC Host Controller Architecture

The SD/MMC host controller consists of two main functional blocks, as shown in Figure 32:

- Bus Interface Unit (BIU): It provides APB interfaces for registers, data read and write operation by FIFO and DMA.
- Card Interface Unit (CIU): It handles external memory card interface protocols. It also provides clock control.

Figure 32: SDIO Host Block Diagram

9.4.1.1 BIU

The BIU provides the access to registers and FIFO data through the Host Interface Unit (HIU). Additionally, it provides FIFO access to independent data through a DMA interface. The host interface can be configured as an APB interface. Figure 32 illustrates the internal components of the BIU. The BIU provides the following functions:

- Host interface
- DMA interface
- Interrupt control
- Register access
- FIFO access
- Power/pull-up control and card detection

9.4.1.2 CIU

The CIU module implements the card-specific protocols. Within the CIU, the command path control unit and data path control unit prompt the controller to interface with the command and data ports, respectively, of the SD/MMC/CE-ATA cards. The CIU also provides clock control. Figure 32 illustrates the internal structure of the CIU, which consists of the following primary functional blocks:

- Command path
- Data path
- SDIO interrupt control
- Clock control
- Mux/demux unit

9.4.2 Command Path

The command path performs the following functions:

- Configures clock parameters
- Configures card command parameters
- Sends commands to card bus (ccmd_out line)
- Receives responses from card bus (ccmd_in line)
- Sends responses to BIU
- Drives the P-bit on the command line

The command path State Machine is shown in Figure 33.

Figure 33: Command Path State Machine

9.4.3 Data Path

The data path block pops FIFO data and transmits them on cdata_out during a write-data transfer, or it receives data on cdata_in and pushes them into FIFO during a read-data transfer. The data path loads new data parameters, i.e., expected data, read/write data transfer, stream/block transfer, block size, byte count, card type, timeout registers, etc., whenever a data transfer command is not in progress.

If the data_expected bit is set in the Command register, the new command is a data-transfer command and the data path starts one of the following operations:

- Transmitting data if the read/write bit = 1
- Receiving data if read/write bit = 0

9.4.3.1 Data Transmit Operation

The data transmit state machine is illustrated in Figure 34. The module starts data transmission two clock cycles after a response for the data-write command is received. This occurs even if the command path detects a response error or a cyclic redundancy check (CRC) error in a response. If no response is received from the card until the response timeout, no data are transmitted. Depending on the value of the transfer_mode bit in the Command register, the data-transmit state machine adds data to the card's data bus in a stream or in block(s). The data transmit state machine is shown in Figure 34.

Figure 34: Data Transmit State Machine

9.4.3.2 Data Receive Operation

The data-receive state machine is illustrated in Figure 35. The module receives data two clock cycles after the end bit of a data-read command, even if the command path detects a response error or a CRC error. If no response is received from the card and a response timeout occurs, the BIU does not receive a signal about the completion of the data transfer. If the command sent by the CIU is an illegal operation for the card, it would prevent the card from starting a read-data transfer, and the BIU will not receive a signal about the completion of the data transfer.

If no data are received by the data timeout, the data path signals a data timeout to the BIU, which marks an end to the data transfer. Based on the value of the transfer_mode bit in the Command register, the data-receive state machine gets data from the card's data bus in a stream or block(s). The data receive state machine is shown in Figure 35.

Figure 35: Data Receive State Machine

9.5 Software Restrictions for Proper CIU Operation

- Only one card at a time can be selected to execute a command or data transfer. For example, when data are being transferred to or from a card, a new command must not be issued to another card. A new command, however, can be issued to the same card, allowing it to read the device status or stop the transfer.
- Only one command at a time can be issued for data transfers.
- During an open-ended card-write operation, if the card clock is stopped due to FIFO being empty, the software must fill FIFO with data first, and then start the card clock. Only then can it issue a stop/abort command to the card.
- During an SDIO/COMBO card transfer, if the card function is suspended and the software wants to resume the suspended transfer, it must first reset FIFO, and then issue the resume command as if it were a new data-transfer command.
- When issuing card reset commands (CMD0, CMD15 or CMD52_reset), while a card data transfer is in progress, the software must set the stop_abort_cmd bit in the Command register, so that the CIU can stop the data transfer after issuing the card reset command.
- When the data's end bit error is set in the RINTSTS register, the CIU does not guarantee SDIO interrupts. In such a case, the software ignores SDIO interrupts and issues a stop/abort command to the card, so that the card stops sending read-data.

- If the card clock is stopped due to FIFO being full during a card read, the software will read at least two FIFO locations to restart the card clock.
- Only one CE-ATA device at a time can be selected for a command or data transfer. For example, when data are transferred from a CE-ATA device, a new command should not be sent to another CE-ATA device.
- If a CE-ATA device's interrupts are enabled (`nLEN=0`), a new `RW_BLK` command should not be sent to the same device if the execution of a `RW_BLK` command is already in progress (the `RW_BLK` command used in this databook is the `RW_MULTIPLE_BLOCK` MMC command defined by the CE-ATA specifications). Only the `CCSD` can be sent while waiting for the `CCS`.
- If, however, a CE-ATA device's interrupts are disabled (`nLEN=1`), a new command can be issued to the same device, allowing it to read status information.
- Open-ended transfers are not supported in CE-ATA devices.
- The `send_auto_stop` signal is not supported (software should not set the `send_auto_stop` bit) in CE-ATA transfers.

After configuring the command start bit to 1, the values of the following registers cannot be changed before a command has been issued:

- `CMD` - command
- `CMDARG` - command argument
- `BYTCNT` - byte count
- `BLKSIZ` - block size
- `CLKDIV` - clock divider
- `CKLENA` - clock enable
- `CLKSRC` - clock source
- `TMOUT` - timeout
- `CTYPE` - card type

9.6 RAM for Receiving and Sending Data

The submodule RAM is a buffer area for sending and receiving data. It can be divided into two units: the one is for sending data, and the other is for receiving data. The process of sending and receiving data can also be achieved by the CPU and DMA for reading and writing. The latter method is described in detail in Section 9.8.

9.6.1 Transmit RAM Module

There are two ways to enable a write operation: DMA and CPU read/write.

If SDIO-sending is enabled, data can be written to the transferred RAM module by APB interface or DMA. Data will be written from register `EMAC_FIFO` to the CPU, directly, by an APB interface.

9.6.2 Receive RAM Module

There are two ways to enable a read operation: DMA and CPU read/write.

When a subunit of the data path receives data, the subdata will be written onto the receive-RAM. Then, these subdata can be read either with the APB or the DMA method at the reading end. Register EMAC_FIFO can be read by the APB directly.

9.7 Descriptor Chain

Each linked list module consists of two parts: the linked list itself and a data buffer. In other words, each module points to a unique data buffer and the linked list that follows the module. Figure 36 shows the descriptor chain.

Figure 36: Descriptor Chain

9.8 The Structure of a Linked List

Each linked list consists of four words. As is shown below, Figure 37 demonstrates the linked list's structure, and Table 34, Table 35, Table 36, Table 37 provide the descriptions of linked lists.

Figure 37: The Structure of a Linked List

The DES0 element contains control and status information.

Table 34: DES0

Bits	Name	Description
31	OWN	When set, this bit indicates that the descriptor is owned by the DMAC. When reset, it indicates that the descriptor is owned by the Host. The DMAC clears this bit when it completes the data transfer.
30	CES (Card Error Summary)	These error bits indicate the status of the transition to or from the card. The following bits are also present in RINTSTS, which indicates their digital logic OR gate. • EBE: End Bit Error • RTO: Response Time out • RCRC: Response CRC • SBE: Start Bit Error • DRT0: Data Read Timeout • DCRC: Data CRC for Receive • RE: Response Error
29:6	Reserved	Reserved
5	ER (End of Ring)	When set, this bit indicates that the descriptor list has reached its final descriptor. The DMAC then returns to the base address of the list, creating a Descriptor Ring.
4	CH (Second Address Chained)	When set, this bit indicates that the second address in the descriptor is the Next Descriptor address. When this bit is set, BS2 (DES1[25:13]) should be all zeros.
3	FD (First Descriptor)	When set, this bit indicates that this descriptor contains the first buffer of the data. If the size of the first buffer is 0, the Next Descriptor contains the beginning of the data.
2	LD (Last Descriptor)	This bit is associated with the last block of a DMA transfer. When set, the bit indicates that the buffers pointed by this descriptor are the last buffers of the data. After this descriptor is completed, the remaining byte count is 0. In other words, after the descriptor with the LD bit set is completed, the remaining byte count should be 0.
1	DIC (Disable Interrupt on Completion)	When set, this bit will prevent the setting of the TI/RI bit of the DMAC Status Register (IDSTS) for the data that ends in the buffer pointed by this descriptor.
0	Reserved	Reserved

The DES1 element contains the buffer size.

Table 35: DES1

Bits	Name	Description
31:26	Reserved	Reserved
25:13	Reserved	Reserved
12:0	BS1 (Buffer 1 Size)	Indicates the data buffer byte size, which must be a multiple of four. In the case where the buffer size is not a multiple of four, the resulting behavior is undefined. This field should not be zero.

The DES2 element contains the address pointer to the data buffer.

Table 36: DES2

Bits	Name	Description
31:0	Buffer Address Pointer 1	These bits indicate the physical address of the data buffer.

The DES3 element contains the address pointer to the next descriptor if the present descriptor is not the last one in a chained descriptor structure.

Table 37: DES3

Bits	Name	Description
31:0	Next Descriptor Address	If the Second Address Chained (DES0[4]) bit is set, then this address contains the pointer to the physical memory where the Next Descriptor is present. If this is not the last descriptor, then the Next Descriptor address pointer must be DES3[1:0] = 0.

9.9 Initialization

9.9.1 DMAC Initialization

The DMAC initialization should proceed as follows:

- Write to the DMAC Bus Mode Register (BMOD_REG) will set the Host bus's access parameters.
- Write to the DMAC Interrupt Enable Register (IDINTEN) will mask any unnecessary interrupt causes.
- The software driver creates either the transmit or the receive descriptor list. Then, it writes to the DMAC Descriptor List Base Address Register (DBADDR), providing the DMAC with the starting address of the list.
- The DMAC engine attempts to acquire descriptors from descriptor lists.

9.9.2 DMAC Transmission Initialization

The DMAC transmission occurs as follows:

1. The Host sets up the elements (DES0-DES3) for transmission, and sets the OWN bit (DES0[31]). The Host also prepares the data buffer.
2. The Host programs the write-data command in the CMD register in BIU.
3. The Host also programs the required transmit threshold (TX_WMARK field in FIFOTH register).
4. The DMAC engine fetches the descriptor and checks the OWN bit. If the OWN bit is not set, it means that the host owns the descriptor. In this case, the DMAC enters a suspend-state and asserts the Descriptor Unable interrupt in the IDSTS register. In such a case, the host needs to release the DMAC by writing any value to PLDMND_REG.
5. It then waits for the Command Done (CD) bit and no errors from BIU, which indicates that a transfer can be done.
6. Subsequently, the DMAC engine waits for a DMA interface request (dw_dma_req) from BIU. This request will be generated, based on the programmed transmit-threshold value. For the last bytes of data which cannot be accessed using a burst, single transfers are performed on the AHB Master Interface.
7. The DMAC fetches the transmit data from the data buffer in the Host memory and transfers them to FIFO for transmission to card.
8. When data span across multiple descriptors, the DMAC fetches the next descriptor and extends its operation using the following descriptor. The last descriptor bit indicates whether the data span multiple descriptors or not.
9. When data transmission is complete, the status information is updated in the IDSTS register by setting the Transmit Interrupt, if it has already been enabled. Also, the OWN bit is cleared by the DMAC by performing a write transaction to DES0.

9.9.3 DMAC Reception Initialization

The DMAC reception occurs as follows:

1. The Host sets up the element (DES0-DES3) for reception, and sets the OWN bit (DES0[31]).
2. The Host programs the read-data command in the CMD register in BIU.
3. Then, the Host programs the required level of the receive-threshold (RX_WMARK field in FIFOTH register).
4. The DMAC engine fetches the descriptor and checks the OWN bit. If the OWN bit is not set, it means that the host owns the descriptor. In this case, the DMA enters a suspend-state and asserts the Descriptor Unable interrupt in the IDSTS register. In such a case, the host needs to release the DMAC by writing any value to PLDMND_REG.
5. It then waits for the Command Done (CD) bit and no errors from BIU, which indicates that a transfer can be done.
6. The DMAC engine then waits for a DMA interface request (dw_dma_req) from BIU. This request will be generated, based on the programmed receive-threshold value. For the last bytes of the data which cannot be accessed using a burst, single transfers are performed on the AHB.
7. The DMAC fetches the data from FIFO and transfers them to the Host memory.

8. When data span across multiple descriptors, the DMAC will fetch the next descriptor and extend its operation using the following descriptor. The last descriptor bit indicates whether the data span multiple descriptors or not.
9. When data reception is complete, the status information is updated in the IDSTS register by setting Receive-Interrupt, if it has already been enabled. Also, the OWN bit is cleared by the DMAC by performing a write-transaction to DES0.

9.10 Clock Phase Selection

If the setup time requirements for the input or output data signal are not met, users can specify the clock phase, as shown in the figure below.

Figure 38: Clock Phase Selection

Please find detailed information on the clock phase selection register [CLK_EDGE_SEL](#) in Section Registers.

9.11 Interrupt

Interrupts can be generated as a result of various events. The IDSTS register contains all the bits that might cause an interrupt. The IDINTEN register contains an enable bit for each of the events that can cause an interrupt.

There are two groups of summary interrupts, "Normal" ones (bit8 NIS) and "Abnormal" ones (bit9 AIS), as outlined in the IDSTS register. Interrupts are cleared by writing 1 to the position of the corresponding bit. When all the enabled interrupts within a group are cleared, the corresponding summary bit is also cleared. When both summary bits are cleared, the interrupt signal `dmac_intr_o` is de-asserted (stops signalling).

Interrupts are not queued up, and if a new interrupt-event occurs before the driver has responded to it, no additional interrupts are generated. For example, the Receive Interrupt IDSTS[1] indicates that one or more data were transferred to the Host buffer.

An interrupt is generated only once for concurrent events. The driver must scan the IDSTS register for the interrupt cause.

9.12 Register Summary

Name	Description	Address	Access
CTRL_REG	Control register	0x0000	R/W
CLKDIV_REG	Clock divider configuration register	0x0008	R/W
CLKSRC_REG	Clock source selection register	0x000C	R/W
CLKENA_REG	Clock enable register	0x0010	R/W
TMOUT_REG	Data and response timeout configuration register	0x0014	R/W
CTYPE_REG	Card bus width configuration register	0x0018	R/W
BLKSIZ_REG	Card data block size configuration register	0x001C	R/W
BYTCNT_REG	Data transfer length configuration register	0x0020	R/W
INTMASK_REG	SDIO interrupt mask register	0x0024	R/W
CMDARG_REG	Command argument data register	0x0028	R/W
CMD_REG	Command and boot configuration register	0x002C	R/W
RESP0_REG	Response data register	0x0030	RO
RESP1_REG	Long response data register	0x0034	RO
RESP2_REG	Long response data register	0x0038	RO
RESP3_REG	Long response data register	0x003C	RO
MINTSTS_REG	Masked interrupt status register	0x0040	RO
RINTSTS_REG	Raw interrupt status register	0x0044	R/W
STATUS_REG	SD/MMC status register	0x0048	RO
FIFOTH_REG	FIFO configuration register	0x004C	R/W
CDETECT_REG	Card detect register	0x0050	RO
WRTPRT_REG	Card write protection (WP) status register	0x0054	RO
TCBCNT_REG	Transferred byte count register	0x005C	RO
TBBCNT_REG	Transferred byte count register	0x0060	RO
DEBNCE_REG	Debounce filter time configuration register	0x0064	R/W
USRID_REG	User ID (scratchpad) register	0x0068	R/W
RST_N_REG	Card reset register	0x0078	R/W
BMOD_REG	Burst mode transfer configuration register	0x0080	R/W
PLDMND_REG	Poll demand configuration register	0x0084	WO
DBADDR_REG	Descriptor base address register	0x0088	R/W
IDSTS_REG	IDMAC status register	0x008C	R/W
IDINTEN_REG	IDMAC interrupt enable register	0x0090	R/W
DSCADDR_REG	Host descriptor address pointer	0x0094	RO
BUFADDR_REG	Host buffer address pointer register	0x0098	RO
CLK_EDGE_SEL	Clock phase selection register	0x0800	R/W

9.13 Registers

SD/MMC controller registers can be accessed by the APB bus of the CPU.

Register 9.1: CTRL_REG (0x0000)

(reserved)										(reserved)										(reserved)										CEATA_DEVICE_INTERRUPT_STATUS SEND_AUTO_STOP_CCSD SEND_CCSD ABORT_READ_DATA SEND_IRQ_RESPONSE READ_WAIT (reserved) INT_ENABLE (reserved) DMA_RESET FIFO_RESET CONTROLLER_RESET											
31											25	24	131											120	11	10	9	8	7	6	5	4	3	2	1	0					
0x00										1	0x00										0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset					

CEATA_DEVICE_INTERRUPT_STATUS Software should appropriately write to this bit after the power-on reset or any other reset to the CE-ATA device. After reset, the CE-ATA device's interrupt is usually disabled ($nIEN = 1$). If the host enables the CE-ATA device's interrupt, then software should set this bit. (R/W)

SEND_AUTO_STOP_CCSD Always set `send_auto_stop_ccsd` and `send_ccsd` bits together; `send_auto_stop_ccsd` should not be set independently of `send_ccsd`. When set, SD/MMC automatically sends an internally-generated STOP command (CMD12) to the CE-ATA device. After sending this internally-generated STOP command, the Auto Command Done (ACD) bit in RINTSTS is set and an interrupt is generated for the host, in case the ACD interrupt is not masked. After sending the Command Completion Signal Disable (CCSD), SD/MMC automatically clears the `send_auto_stop_ccsd` bit. (R/W)

SEND_CCSD When set, SD/MMC sends CCSD to the CE-ATA device. Software sets this bit only if the current command is expecting CCS (that is, `RW_BLK`), and if interrupts are enabled for the CE-ATA device. Once the CCSD pattern is sent to the device, SD/MMC automatically clears the `send_ccsd` bit. It also sets the Command Done (CD) bit in the RINTSTS register, and generates an interrupt for the host, in case the Command Done interrupt is not masked. NOTE: Once the `send_ccsd` bit is set, it takes two card clock cycles to drive the CCSD on the CMD line. Due to this, within the boundary conditions the CCSD may be sent to the CE-ATA device, even if the device has signalled CCS. (R/W)

ABORT_READ_DATA After a suspend-command is issued during a read-operation, software polls the card to find when the suspend-event occurred. Once the suspend-event has occurred, software sets the bit which will reset the data state machine that is waiting for the next block of data. This bit is automatically cleared once the data state machine is reset to idle. (R/W)

SEND_IRQ_RESPONSE Bit automatically clears once response is sent. To wait for MMC card interrupts, host issues CMD40 and waits for interrupt response from MMC card(s). In the meantime, if host wants SD/MMC to exit waiting for interrupt state, it can set this bit, at which time SD/MMC command state-machine sends CMD40 response on bus and returns to idle state. (R/W)

196

ESP32 Technical Reference Manual V3.1

CONTROLLER_RESET To reset controller, firmware should set this bit. This bit is auto-cleared after two AHB and two cclk_in clock cycles. (R/W)

Register 9.3: CLKDIV_REG (0x0008)

CLK_DIVIDER3								CLK_DIVIDER2								CLK_DIVIDER1								CLK_DIVIDER0															
31	24	23	16	15	8	7	0																																
0x000								0x000								0x000								0x000								Reset							

CLK_DIVIDER3 Clock divider-3 value. Clock division factor is 2^n , where $n=0$ bypasses the divider (division factor of 1). For example, a value of 1 means divide by $2^1 = 2$, a value of 0xFF means divide by $2^{255} = 510$, and so on. In MMC-Ver3.3-only mode, these bits are not implemented because only one clock divider is supported. (R/W)

CLK_DIVIDER2 Clock divider-2 value. Clock division factor is 2^n , where $n=0$ bypasses the divider (division factor of 1). For example, a value of 1 means divide by $2^1 = 2$, a value of 0xFF means divide by $2^{255} = 510$, and so on. In MMC-Ver3.3-only mode, these bits are not implemented because only one clock divider is supported. (R/W)

CLK_DIVIDER1 Clock divider-1 value. Clock division factor is 2^n , where $n=0$ bypasses the divider (division factor of 1). For example, a value of 1 means divide by $2^1 = 2$, a value of 0xFF means divide by $2^{255} = 510$, and so on. In MMC-Ver3.3-only mode, these bits are not implemented because only one clock divider is supported. (R/W)

CLK_DIVIDER0 Clock divider-0 value. Clock division factor is 2^n , where $n=0$ bypasses the divider (division factor of 1). For example, a value of 1 means divide by $2^1 = 2$, a value of 0xFF means divide by $2^{255} = 510$, and so on. In MMC-Ver3.3-only mode, these bits are not implemented because only one clock divider is supported. (R/W)

Register 9.4: CLKSRC_REG (0x000C)

(reserved)																CLKSRC_REG														
31																4 3 0														
0x000000																0x0														Reset

CLKSRC_REG Clock divider source for two SD cards is supported. Each card has two bits assigned to it. For example, bit[1:0] are assigned for card 0, bit[3:2] are assigned for card 1. Card 0 maps and internally routes clock divider[0:3] outputs to cclk_out[1:0] pins, depending on bit value.

00 : Clock divider 0;

01 : Clock divider 1;

10 : Clock divider 2;

11 : Clock divider 3.

In MMC-Ver3.3-only controller, only one clock divider is supported. The cclk_out is always from clock divider 0, and this register is not implemented. (R/W)

Register 9.5: CLKENA_REG (0x0010)

(reserved)																CCLK_ENABEL		
31															2	1	0	
0x00000																0x00000		Reset

CCLK_ENABEL Clock-enable control for two SD card clocks and one MMC card clock is supported.

0: Clock disabled;

1: Clock enabled.

In MMC-Ver3.3-only mode, since there is only one cclk_out, only cclk_enable[0] is used. (R/W)

Register 9.6: TMOUT_REG (0x0014)

DATA_TIMEOUT																RESPONSE_TIMEOUT		
31															8	7	0	
0x0FFFFFF																0x040		Reset

DATA_TIMEOUT Value for card data read timeout. This value is also used for data starvation by host timeout. The timeout counter is started only after the card clock is stopped. This value is specified in number of card output clocks, i.e. cclk_out of the selected card.

NOTE: The software timer should be used if the timeout value is in the order of 100 ms. In this case, read data timeout interrupt needs to be disabled. (R/W)

RESPONSE_TIMEOUT Response timeout value. Value is specified in terms of number of card output clocks, i.e., cclk_out. (R/W)

Register 9.7: CTYPE_REG (0x0018)

(reserved)																		CARD_WIDTH8		(reserved)																		CARD_WIDTH4	
31																	18			17	16	15											2	1	0				
0x00000																				0x00000		0x00000										0x00000		Reset					

CARD_WIDTH8 One bit per card indicates if card is in 8-bit mode.

0: Non 8-bit mode;

1: 8-bit mode.

Bit[17:16] correspond to card[1:0] respectively. (R/W)

CARD_WIDTH4 One bit per card indicates if card is 1-bit or 4-bit mode.

0: 1-bit mode;

1: 4-bit mode.

Bit[1:0] correspond to card[1:0] respectively. Only NUM_CARDS*2 number of bits are implemented. (R/W)

Register 9.8: BLKSIZ_REG (0x001C)

(reserved)																BLOCK_SIZE																																																																																																																																															
31																16																15																0																																																																																																															
0																0																0																0																0																0																0																0																0x00200																Reset															

BLOCK_SIZE Block size. (R/W)

Register 9.9: BYTCNT_REG (0x0020)

31																													0	
0x000000200																														Reset

BYTCNT_REG Number of bytes to be transferred, should be an integral multiple of Block Size for block transfers. For data transfers of undefined byte lengths, byte count should be set to 0. When byte count is set to 0, it is the responsibility of host to explicitly send stop/abort command to terminate data transfer. (R/W)

Register 9.10: INTMASK_REG (0x0024)

(reserved)										SDIO_INT_MASK				INT_MASK																	
31																		18	17	16	15										0
0x00000										0x00000				0x00000																	Reset

SDIO_INT_MASK SDIO interrupt mask, one bit for each card. Bit[17:16] correspond to card[15:0] respectively. When masked, SDIO interrupt detection for that card is disabled. 0 masks an interrupt, and 1 enables an interrupt. In MMC-Ver3.3-only mode, these bits are always 0. (R/W)

INT_MASK These bits used to mask unwanted interrupts. A value of 0 masks interrupt, and a value of 1 enables the interrupt. (R/W)

Bit 15 (EBE): End-bit error, read/write (no CRC)

Bit 14 (ACD): Auto command done

Bit 13 (SBE/BCI): Start Bit Error/Busy Clear Interrupt

Bit 12 (HLE): Hardware locked write error

Bit 11 (FRUN): FIFO underrun/overflow error

Bit 10 (HTO): Data starvation-by-host timeout/Volt_switch_int

Bit 9 (DRTO): Data read timeout

Bit 8 (RTO): Response timeout

Bit 7 (DCRC): Data CRC error

Bit 6 (RCRC): Response CRC error

Bit 5 (RXDR): Receive FIFO data request

Bit 4 (TXDR): Transmit FIFO data request

Bit 3 (DTO): Data transfer over

Bit 2 (CD): Command done

Bit 1 (RE): Response error

Bit 0 (CD): Card detect

Register 9.11: CMDARG_REG (0x0028)

31																															0	
0x00000000																																Reset

CMDARG_REG Value indicates command argument to be passed to the card. (R/W)

Register 9.12: CMD_REG (0x002C)

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	8	7	6	5	0	Reset
0	0	1	0	0	0	0	0	0	0	0	0	0x00	0	0	0	0	0	0	0	0	0	0	0	0x00	

START_CMD Start command. Once command is served by the CIU, this bit is automatically cleared.

When this bit is set, host should not attempt to write to any command registers. If a write is attempted, hardware lock error is set in raw interrupt register. Once command is sent and a response is received from SD/MMC_CEATA cards, Command Done bit is set in the raw interrupt Register. (R/W)

USE_HOLE Use Hold Register. (R/W) 0: CMD and DATA sent to card bypassing HOLD Register; 1: CMD and DATA sent to card through the HOLD Register.

CCS_EXPECTED Expected Command Completion Signal (CCS) configuration. (R/W)

0: Interrupts are not enabled in CE-ATA device ($nIEN = 1$ in ATA control register), or command does not expect CCS from device.

1: Interrupts are enabled in CE-ATA device ($nIEN = 0$), and RW_BLK command expects command completion signal from CE-ATA device.

If the command expects Command Completion Signal (CCS) from the CE-ATA device, the software should set this control bit. SD/MMC sets Data Transfer Over (DTO) bit in RINTSTS register and generates interrupt to host if Data Transfer Over interrupt is not masked.

READ_CEATA_DEVICE Read access flag. (R/W)

0: Host is not performing read access (RW_REG or RW_BLK) towards CE-ATA device

1: Host is performing read access (RW_REG or RW_BLK) towards CE-ATA device.

Software should set this bit to indicate that CE-ATA device is being accessed for read transfer. This bit is used to disable read data timeout indication while performing CE-ATA read transfers. Maximum value of I/O transmission delay can be no less than 10 seconds. SD/MMC should not indicate read data timeout while waiting for data from CE-ATA device. (R/W)

Register 9.13: CMD_REG (continued) (0x002C)

START_CMD (reserved)																												USE_HOLE (reserved)																												(reserved)																												(reserved)																												(reserved)																												CCS_EXPECTED																												READ_CEATA_DEVICE																												UPDATE_CLOCK_REGISTERS_ONLY																												CARD_NUMBER																												SEND_INITIALIZATION																												STOP_ABORT_CMD																												SEND_PRIVDATA_COMPLETE																												TRANSFER_MODE																												READ_EXPECTED																												CHECK_RESPONSE_CRC																												RESPONSE_LENGTH																												RESPONSE_EXPECT																												CMD_INDEX																											
31	30	29	28	27	26	25	24	23	22	21	20									16	15	14	13	12	11	10	9	8	7	6	5									0

UPDATE_CLOCK_REGISTERS_ONLY (R/W)

0: Normal command sequence.

1: Do not send commands, just update clock register value into card clock domain

Following register values are transferred into card clock domain: CLKDIV, CLRSRC, and CLKENA. Changes card clocks (change frequency, truncate off or on, and set low-frequency mode). This is provided in order to change clock frequency or stop clock without having to send command to cards.

During normal command sequence, when update_clock_registers_only = 0, following control registers are transferred from BIU to CIU: CMD, CMDARG, TMOUT, CTYPE, BLKSIZ, and BYTCNT. CIU uses new register values for new command sequence to card(s). When bit is set, there are no Command Done interrupts because no command is sent to SD_MMC_CEATA cards.

CARD_NUMBER Card number in use. Represents physical slot number of card being accessed. In MMC-Ver3.3-only mode, up to two cards are supported. In SD-only mode, up to two cards are supported. (R/W)

SEND_INITIALIZATION (R/W)

0: Do not send initialization sequence (80 clocks of 1) before sending this command.

1: Send initialization sequence before sending this command.

After power on, 80 clocks must be sent to card for initialization before sending any commands to card. Bit should be set while sending first command to card so that controller will initialize clocks before sending command to card.

STOP_ABORT_CMD (R/W)

0: Neither stop nor abort command can stop current data transfer. If abort is sent to function-number currently selected or not in data-transfer mode, then bit should be set to 0.

1: Stop or abort command intended to stop current data transfer in progress. When open-ended or predefined data transfer is in progress, and host issues stop or abort command to stop data transfer, bit should be set so that command/data state-machines of CIU can return correctly to idle state.

Register 9.14: CMD_REG (continued) (0x002C)

31	30	29	28	27	26	25	24	23	22	21	20	16	15	14	13	12	11	10	9	8	7	6	5	0	
0	0	1	0	0	0	0	0	0	0	0	0	0x00	0	0	0	0	0	0	0	0	0	0	0	0x00	Reset

WAIT_PRVDATA_COMPLETE (R/W)

- 0: Send command at once, even if previous data transfer has not completed;
- 1: Wait for previous data transfer to complete before sending Command.

The wait_prvdata_complete = 0 option is typically used to query status of card during data transfer or to stop current data transfer. card_number should be same as in previous command.

SEND_AUTO_STOP (R/W)

- 0: No stop command is sent at the end of data transfer;
- 1: Send stop command at the end of data transfer.

TRANSFER_MODE (R/W)

- 0: Block data transfer command;
- 1: Stream data transfer command. Don't care if no data expected.

READ/WRITE (R/W)

- 0: Read from card;
 - 1: Write to card.
- Don't care if no data is expected from card.

DATA_EXPECTED (R/W)

- 0: No data transfer expected.
- 1: Data transfer expected.

CHECK_RESPONSE_CRC (R/W)

- 0: Do not check;
- 1: Check response CRC.

Some of command responses do not return valid CRC bits. Software should disable CRC checks for those commands in order to disable CRC checking by controller.

RESPONSE_LENGTH (R/W)

- 0: Short response expected from card;
- 1: Long response expected from card.

RESPONSE_EXPECT (R/W)

- 0: No response expected from card;
- 1: Response expected from card.

CMD_INDEX Command index. (R/W)

Register 9.15: RESP0_REG (0x0030)

31	0
0x00000000	
Reset	

RESP0_REG Bit[31:0] of response. (RO)

Register 9.16: RESP1_REG (0x0034)

31	0
0x00000000	
Reset	

RESP1_REG Bit[63:32] of long response. (RO)

Register 9.17: RESP2_REG (0x0038)

31	0
0x00000000	
Reset	

RESP2_REG Bit[95:64] of long response. (RO)

Register 9.18: RESP3_REG (0x003C)

31	0
0x00000000	
Reset	

RESP3_REG Bit[127:96] of long response. (RO)

Register 9.19: MINTSTS_REG (0x0040)

(reserved)																		SDIO_INTERRUPT_MSK					INT_STATUS_MSK									
31																		18	17	16	15											0
0																		0x0		0x00000												Reset

SDIO_INTERRUPT_MSK Interrupt from SDIO card, one bit for each card. Bit[17:16] correspond to card1 and card0, respectively. SDIO interrupt for card is enabled only if corresponding sdio_int_mask bit is set in Interrupt mask register (Setting mask bit enables interrupt). (RO)

INT_STATUS_MSK Interrupt enabled only if corresponding bit in interrupt mask register is set. (RO)

- Bit 15 (EBE): End-bit error, read/write (no CRC)
- Bit 14 (ACD): Auto command done
- Bit 13 (SBE/BCI): Start Bit Error/Busy Clear Interrupt
- Bit 12 (HLE): Hardware locked write error
- Bit 11 (FRUN): FIFO underrun/overrun error
- Bit 10 (HTO): Data starvation by host timeout (HTO)
- Bit 9 (DTRO): Data read timeout
- Bit 8 (RTO): Response timeout
- Bit 7 (DCRC): Data CRC error
- Bit 6 (RCRC): Response CRC error
- Bit 5 (RXDR): Receive FIFO data request
- Bit 4 (TXDR): Transmit FIFO data request
- Bit 3 (DTO): Data transfer over
- Bit 2 (CD): Command done
- Bit 1 (RE): Response error
- Bit 0 (CD): Card detect

Register 9.20: RINTSTS_REG (0x0044)

SDIO_INTERRUPT_RAW Interrupt from SDIO card, one bit for each card. Bit[17:16] correspond to card1 and card0, respectively. Setting a bit clears the corresponding interrupt bit and writing 0 has no effect. (R/W)

0: No SDIO interrupt from card;

1: SDIO interrupt from card.

In MMC-Ver3.3-only mode, these bits are always 0. Bits are logged regardless of interrupt-mask status. (R/W)

INT_STATUS_RAW Setting a bit clears the corresponding interrupt and writing 0 has no effect. Bits are logged regardless of interrupt mask status. (R/W)

Bit 15 (EBE): End-bit error, read/write (no CRC)

Bit 14 (ACD): Auto command done

Bit 13 (SBE/BCI): Start Bit Error/Busy Clear Interrupt

Bit 12 (HLE): Hardware locked write error

Bit 11 (FRUN): FIFO underrun/overrun error

Bit 10 (HTO): Data starvation by host timeout (HTO)

Bit 9 (DTRO): Data read timeout

Bit 8 (RTO): Response timeout

Bit 7 (DCRC): Data CRC error

Bit 6 (RCRC): Response CRC error

Bit 5 (RXDR): Receive FIFO data request

Bit 4 (TXDR): Transmit FIFO data request

Bit 3 (DTO): Data transfer over

Bit 2 (CD): Command done

Bit 1 (RE): Response error

Bit 0 (CD): Card detect

Register 9.21: STATUS_REG (0x0048)

(reserved)		FIFO_COUNT															RESPONSE_INDEX		DATA_STATE_MC_BUSY		DATA_BUSY		DATA_3_STATUS		COMMAND_FSM_STATES		FIFO_FULL	FIFO_EMPTY	FIFO_TX_WATERMARK	FIFO_RX_WATERMARK
31	30	29														17	16	11	10	9	8	7	4	3	2	1	0			
0	0	0x000													0x00		1	1	1	0x01		0	1	1	0	Reset				

FIFO_COUNT FIFO count, number of filled locations in FIFO. (RO)

RESPONSE_INDEX Index of previous response, including any auto-stop sent by core. (RO)

DATA_STATE_MC_BUSY Data transmit or receive state-machine is busy. (RO)

DATA_BUSY Inverted version of raw selected card_data[0]. (RO)

- 0: Card data not busy;
- 1: Card data busy.

DATA_3_STATUS Raw selected card_data[3], checks whether card is present. (RO)

- 0: card not present;
- 1: card present.

COMMAND_FSM_STATES Command FSM states. (RO)

- 0: Idle
- 1: Send init sequence
- 2: Send cmd start bit
- 3: Send cmd tx bit
- 4: Send cmd index + arg
- 5: Send cmd crc7
- 6: Send cmd end bit
- 7: Receive resp start bit
- 8: Receive resp IRQ response
- 9: Receive resp tx bit
- 10: Receive resp cmd idx
- 11: Receive resp data
- 12: Receive resp crc7
- 13: Receive resp end bit
- 14: Cmd path wait NCC
- 15: Wait, cmd-to-response turnaround

FIFO_FULL FIFO is full status. (RO)

FIFO_EMPTY FIFO is empty status. (RO)

FIFO_TX_WATERMARK FIFO reached Transmit watermark level, not qualified with data transfer. (RO)

FIFO_RX_WATERMARK FIFO reached Receive watermark level, not qualified with data transfer. (RO)

Register 9.22: FIFOTH_REG (0x004C)

(reserved)				DMA_MULTIPLE_TRANSACTION_SIZE				(reserved)				RX_WMARK				(reserved)				TX_WMARK			
31	30	28	27	26								16	15			12	11						0
0	0x0	0	0	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0x0000			

Reset

DMA_MULTIPLE_TRANSACTION_SIZE Burst size of multiple transaction, should be programmed same as DMA controller multiple-transaction-size SRC/DEST_MSIZ. 000: 1-byte transfer; 001: 4-byte transfer; 010: 8-byte transfer; 011: 16-byte transfer; 100: 32-byte transfer; 101: 64-byte transfer; 110: 128-byte transfer; 111: 256-byte transfer. (R/W)

RX_WMARK FIFO threshold watermark level when receiving data to card. When FIFO data count reaches greater than this number (FIFO_RX_WATERMARK), DMA/FIFO request is raised. During end of packet, request is generated regardless of threshold programming in order to complete any remaining data. In non-DMA mode, when receiver FIFO threshold (RXDR) interrupt is enabled, then interrupt is generated instead of DMA request. During end of packet, interrupt is not generated if threshold programming is larger than any remaining data. It is responsibility of host to read remaining bytes on seeing Data Transfer Done interrupt. In DMA mode, at end of packet, even if remaining bytes are less than threshold, DMA request does single transfers to flush out any remaining bytes before Data Transfer Done interrupt is set. (R/W)

TX_WMARK FIFO threshold watermark level when transmitting data to card. When FIFO data count is less than or equal to this number (FIFO_TX_WATERMARK), DMA/FIFO request is raised. If interrupt is enabled, then interrupt occurs. During end of packet, request or interrupt is generated, regardless of threshold programming. In non-DMA mode, when transmit FIFO threshold (TXDR) interrupt is enabled, then interrupt is generated instead of DMA request. During end of packet, on last interrupt, host is responsible for filling FIFO with only required remaining bytes (not before FIFO is full or after CIU completes data transfers, because FIFO may not be empty). In DMA mode, at end of packet, if last transfer is less than burst size, DMA controller does single cycles until required bytes are transferred. (R/W)

Register 9.23: CDETECT_REG (0x0050)

(reserved)																CARD_DETECT_N		
31																2	1	0
0x0																0x0		Reset

CARD_DETECT_N Value on card_detect_n input ports (1 bit per card), read-only bits. 0 represents presence of card. Only NUM_CARDS number of bits are implemented. (RO)

Register 9.24: WRTprt_REG (0x0054)

(reserved)		WRITE_PROTECT	
31	2	1	0
0x0		0x0	
		Reset	

WRITE_PROTECT Value on card_write_prt input ports (1 bit per card). 1 represents write protection. Only NUM_CARDS number of bits are implemented. (RO)

Register 9.25: TCBCNT_REG (0x005C)

31	0
0x00000000	
Reset	

TCBCNT_REG Number of bytes transferred by CIU unit to card. (RO)

Register 9.26: TBBCNT_REG (0x0060)

31	0
0x00000000	
Reset	

TBBCNT_REG Number of bytes transferred between Host/DMA memory and BIU FIFO. (RO)

Register 9.27: DEBNCE_REG (0x0064)

(reserved)		DEBOUNCE_COUNT	
31	24	23	0
0	0	0	0
0	0	0	0
0	0	0	0
0	0	0	0
0	0	0	0
0	0	0	0
0x00000000		Reset	

DEBOUNCE_COUNT Number of host clocks (clk) used by debounce filter logic. The typical debounce time is 5 ~ 25 ms to prevent the card instability when the card is inserted or removed. (R/W)

Register 9.28: USRID_REG (0x0068)

31	0
0x00000000	
Reset	

USRID_REG User identification register, value set by user. Default reset value can be picked by user while configuring core before synthesis. Can also be used as a scratchpad register by user. (R/W)

Register 9.29: RST_N_REG (0x0078)

--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

RST_CARD_RESET Hardware reset. 1: Active mode; 0: Reset. These bits cause the cards to enter pre-idle state, which requires them to be re-initialized. CARD_RESET[0] should be set to 1'b0 to reset card0, CARD_RESET[1] should be set to 1'b0 to reset card1. The number of bits implemented is restricted to NUM_CARDS. (R/W)

Register 9.30: BMOD_REG (0x0080)

(reserved)										BMOD_PBL		BMOD_DE		(reserved)		BMOD_FB BMOD_SWPR			
31										11		10	8	7	6	2		1	0
0 0										0x0		0	0x00		0	0	Reset		

Register 9.31: PLDMND_REG (0x0080)

31	0
0x00000000	
Reset	

PLDMND_REG Poll Demand. If the OWN bit of a descriptor is not set, the FSM goes to the Suspend state. The host needs to write any value into this register for the IDMAC FSM to resume normal descriptor fetch operation. This is a write only register, PD bit is write-only. (WO)

Register 9.32: DBADDR_REG (0x0088)

31	0
0x00000000	
Reset	

DBADDR_REG Start of Descriptor List. Contains the base address of the First Descriptor. The LSB bits [1:0] are ignored and taken as all-zero by the IDMAC internally. Hence these LSB bits may be treated as read-only. (R/W)

Register 9.33: IDSTS_REG (0x008C)

(reserved)																IDSTS_FSM		IDSTS_FBE_CODE		IDSTS_AIS	IDSTS_NIS	(reserved)		IDSTS_CES	IDSTS_DU	(reserved)		IDSTS_FBE	IDSTS_FI	IDSTS_T1			
31																17	16	13	12	10	9	8	7	6	5	4	3	2	1	0			
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0																0x00		0x0		0		0	0	0	0	0	0	0	0	0	0	0	Reset

IDSTS_FSM DMAC FSM present state: (RO)

0: DMA_IDLE; 1: DMA_SUSPEND; 2: DESC_RD; 3: DESC_CHK; 4: DMA_RD_REQ_WAIT
5: DMA_WR_REQ_WAIT; 6: DMA_RD; 7: DMA_WR; 8: DESC_CLOSE.

IDSTS_FBE_CODE Fatal Bus Error Code. Indicates the type of error that caused a Bus Error. Valid only when the Fatal Bus Error bit IDSTS[2] is set. This field does not generate an interrupt. (RO)
3b001: Host Abort received during transmission;
3b010: Host Abort received during reception;
Others: Reserved.

IDSTS_AIS Abnormal Interrupt Summary. Logical OR of the following: IDSTS[2] : Fatal Bus Interrupt, IDSTS[4] : DU bit Interrupt. Only unmasked bits affect this bit. This is a sticky bit and must be cleared each time a corresponding bit that causes AIS to be set is cleared. Writing 1 clears this bit. (R/W)

IDSTS_NIS Normal Interrupt Summary. Logical OR of the following: IDSTS[0] : Transmit Interrupt, IDSTS[1] : Receive Interrupt. Only unmasked bits affect this bit. This is a sticky bit and must be cleared each time a corresponding bit that causes NIS to be set is cleared. Writing 1 clears this bit. (R/W)

IDSTS_CES Card Error Summary. Indicates the status of the transaction to/from the card, also present in RINTSTS. Indicates the logical OR of the following bits: EBE : End Bit Error, RTO : Response Timeout/Boot Ack Timeout, RCRC : Response CRC, SBE : Start Bit Error, DRTO : Data Read Timeout/BDS timeout, DCRC : Data CRC for Receive, RE : Response Error.
Writing 1 clears this bit. The abort condition of the IDMAC depends on the setting of this CES bit. If the CES bit is enabled, then the IDMAC aborts on a response error. (R/W)

IDSTS_DU Descriptor Unavailable Interrupt. This bit is set when the descriptor is unavailable due to OWN bit = 0 (DES0[31] =0). Writing 1 clears this bit. (R/W)

IDSTS_FBE Fatal Bus Error Interrupt. Indicates that a Bus Error occurred (IDSTS[12:10]) . When this bit is set, the DMA disables all its bus accesses. Writing 1 clears this bit. (R/W)

IDSTS_RI Receive Interrupt. Indicates the completion of data reception for a descriptor. Writing 1 clears this bit. (R/W)

IDSTS_TI Transmit Interrupt. Indicates that data transmission is finished for a descriptor. Writing 1 clears this bit. (R/W)

Register 9.34: IDINTEN_REG (0x0090)

(reserved)										IDINTEN_AI	IDINTEN_NI	(reserved)	IDINTEN_CES	IDINTEN_DU	(reserved)	IDINTEN_FBE	IDINTEN_RI	IDINTEN_TI			
31											10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset	

IDINTEN_AI Abnormal Interrupt Summary Enable. (R/W)

When set, an abnormal interrupt is enabled. This bit enables the following bits:

IDINTEN[2]: Fatal Bus Error Interrupt;

IDINTEN[4]: DU Interrupt.

IDINTEN_NI Normal Interrupt Summary Enable. (R/W)

When set, a normal interrupt is enabled. When reset, a normal interrupt is disabled. This bit enables the following bits:

IDINTEN[0]: Transmit Interrupt;

IDINTEN[1]: Receive Interrupt.

IDINTEN_CES Card Error summary Interrupt Enable. When set, it enables the Card Interrupt summary. (R/W)

IDINTEN_DU Descriptor Unavailable Interrupt. When set along with Abnormal Interrupt Summary Enable, the DU interrupt is enabled. (R/W)

IDINTEN_FBE Fatal Bus Error Enable. When set with Abnormal Interrupt Summary Enable, the Fatal Bus Error Interrupt is enabled. When reset, Fatal Bus Error Enable Interrupt is disabled. (R/W)

IDINTEN_RI Receive Interrupt Enable. When set with Normal Interrupt Summary Enable, Receive Interrupt is enabled. When reset, Receive Interrupt is disabled. (R/W)

IDINTEN_TI Transmit Interrupt Enable. When set with Normal Interrupt Summary Enable, Transmit Interrupt is enabled. When reset, Transmit Interrupt is disabled. (R/W)

Register 9.35: DSCADDR_REG (0x0094)

31																					0
0x00000000																					Reset

DSCADDR_REG Host Descriptor Address Pointer, updated by IDMAC during operation and cleared on reset. This register points to the start address of the current descriptor read by the IDMAC. (RO)

Register 9.36: BUFADDR_REG (0x0098)

31	0
0x00000000	
Reset	

BUFADDR_REG Host Buffer Address Pointer, updated by IDMAC during operation and cleared on reset. This register points to the current Data Buffer Address being accessed by the IDMAC. (RO)

Register 9.37: CLK_EDGE_SEL (0x0800)

(reserved)												COLKIN_EDGE_N				COLKIN_EDGE_L				COLKIN_EDGE_H				COLKIN_EDGE_SLF_SEL				COLKIN_EDGE_SAM_SEL				COLKIN_EDGE_DRV_SEL							
31212017												1613				129				86				53				20											
0x000												0x1				0x0				0x1				0x0				0x0				0x0				Reset			

CCLKIN_EDGE_N This value should be equal to CCLKIN_EDGE_L. (R/W)

CCLKIN_EDGE_L The low level of the divider clock. The value should be larger than CCLKIN_EDGE_H. (R/W)

CCLKIN_EDGE_H The high level of the divider clock. The value should be smaller than CCLKIN_EDGE_L. (R/W)

CCLKIN_EDGE_SLF_SEL It is used to select the clock phase of the internal signal from phase90, phase180, or phase270. (R/W)

CCLKIN_EDGE_SAM_SEL It is used to select the clock phase of the input signal from phase90, phase180, or phase270. (R/W)

CCLKIN_EDGE_DRV_SEL It is used to select the clock phase of the output signal from phase90, phase180, or phase270. (R/W)

10. Ethernet MAC

10.1 Overview

Features of Ethernet

By using the external Ethernet PHY (physical layer), ESP32 can send and receive data via Ethernet MAC (Media Access Controller) according to the IEEE 802.3 standard, as Figure 39 shows. Ethernet is currently the most commonly used network protocol that controls how data is transmitted over local- and wide-area networks, abbreviated as LAN and WAN, respectively.

Figure 39: Ethernet MAC Functionality Overview

ESP32 MAC Ethernet complies with the following criteria:

- IEEE 802.3-2002 for Ethernet MAC
- IEEE 1588-2008 standard for specifying the accuracy of networked clock synchronization
- Two industry-standard interfaces conforming with IEEE 802.3-2002: Media-Independent Interface (MII) and Reduced Media-Independent Interface (RMII).

Features of MAC Layer

- Support for a data transmission rate of 10 Mbit/s or 100 Mbit/s through an external PHY interface
- Communication with an external Fast Ethernet PHY through IEEE 802.3-compliant MII and RMII interfaces
- Support for:
 - Carrier Sense Multiple Access / Collision Detection (CSMA/CD) protocol in half-duplex mode
 - IEEE 802.3x flow control in full-duplex mode
 - operations in full-duplex mode, forwarding the received pause-control frame to the user application
 - backpressure flow control in half-duplex mode
 - If the flow control input signal disappears during a full-duplex operation, a pause frame with zero pause time value is automatically transmitted.
- The Preamble and the Start Frame Delimiter (SFD) are inserted in the Transmit path, and deleted in the Receive path.
- Cyclic Redundancy Check (CRC) and Pad can be controlled on a per-frame basis.
- The Pad is generated automatically, if data is below the minimum frame length.

- Programmable frame length supporting jumbo frames of up to 16 KB
- Programmable Inter-frame Gap (IFG) (40-96 bit times in steps of 8)
- Support for a variety of flexible address filtering modes:
 - Up to eight 48-bit perfect address filters to mask each byte
 - Up to eight 48-bit SA address comparison checks to mask each byte
 - All multicast address frames can be transmitted
 - All frames in mixed mode can be transmitted without being filtered for network monitoring
 - A status report is attached each time all incoming packets are transmitted and filtered.
- Returning a 32-bit status for transmission and reception of packets respectively
- Separate transmission, reception, and control interfaces for the application
- Use of the Management Data Input/Output (MDIO) interface to configure and manage PHY devices
- Support for the offloading of received IPv4 and TCP packets encapsulated by an Ethernet frame in the reception function
- Support for checking IPv4 header checksums, as well as TCP, UDP, or ICMP (Internet Control Message Protocol) checksums encapsulated in IPv4/IPv6 packets in the enhanced reception function
- Support for Ethernet frame timestamps. (For details please refer to IEEE 1588-2008.) Each frame has a 64-bit timestamp when transmitted or received.
- Two sets of FIFOs: one 2 KB Tx FIFO with programmable threshold and one 2 KB Rx FIFO with configurable threshold (64 bytes by default)
- When Rx FIFO stores multiple frames, the Receive Status Vector is inserted into the Rx FIFO after transmitting an EOF (end of frame), so that the Rx FIFO does not need to store the Receive Status of these frames.
- In store-and-forward mode, all error frames can be filtered during reception, but not forwarded to the application.
- Under-sized good frames can be forwarded.
- Support for data statistics by generating pulses for lost or corrupted frames in the Rx FIFO due to an overflow
- Support for store-and-forward mechanism when transmitting data to the MAC core
- Automatic re-transmission of collided frames during transmission (subject to certain conditions, see section [10.2.1.2](#))
- Discarding frames in cases of late collisions, excessive collisions, excessive deferrals, and under-run conditions
- The Tx FIFO is flushed by software control.
- Calculating the IPv4 header checksum, as well as the TCP, UDP, or ICMP checksum, and then inserting them into frames transmitted in store-and-forward mode.

Ethernet Block Diagram

Figure [40](#) shows the block diagram of the Ethernet.

Figure 40: Ethernet Block Diagram

Ethernet MAC consists of the MAC-layer configuration register module and three layers: EMAC_CORE (MAC Core Layer), EMAC_MTL (MAC Transition Layer), and EMAC_DMA (Direct Memory Access). Each of these three layers has two directions: Tx and Rx. They are connected to the system through the Advanced High-Performance Bus (AHB) and the Advanced Peripheral Bus (APB) on the chip. Off the chip, they communicate with the external PHY through the MII and RMII interfaces to materialize an Ethernet connection.

10.2 EMAC_CORE

The MAC supports many interfaces with the PHY chip. The PHY interface can be selected only once after reset. The MAC communicates with the application side (DMA side), using the MAC Transmit Interface (MTI), MAC Receive Interface (MRI) and the MAC Control Interface (MCI).

10.2.1 Transmit Operation

A transmit operation is initiated when the MTL Application pushes in data at the time a response signal is asserted. When the SOF (start of frame) signal is detected, the MAC accepts the data and begins transmitting to the RMII or MII. The time required to transmit the frame data to the RMII or MII, after the application initiates transmission, varies, depending on delay factors like IFG delay, time to transmit Preamble or SFD (Start Frame Delimiter), and any back-off delays in half-duplex mode. Until then, the MAC does not accept the data received from MTL by de-asserting the ready signal.

After the EOF (end of frame) is transmitted to the MAC, the MAC completes the normal transmission and yields the Transmit Status to the MTL. If a normal collision (in half-duplex mode) occurs during transmission, the MAC makes valid the Transmit Status in the MTL. It then accepts and drops all further data until the next SOF is received. The MTL block should retransmit the same frame from SOF upon observing a retry request (in the Status) from the MAC.

The MAC issues an underflow status if the MTL is not able to provide the data continuously during transmission. During the normal transmission of a frame from MTL, if the MAC receives an SOF without getting an EOF for the previous frame, it ignores the SOF and considers the new frame as a continuation of the previous one.

10.2.1.1 Transmit Flow Control

In full-duplex mode, when the Transmit Flow Control Enable bit (TFE bit in the Flow Control Register) is set to 1, the MAC will generate and send a pause frame, as needed. The pause frame is added and transmitted together with the calculated CRC. The generation of pause frames can be initiated in two ways.

When the application sets the Flow Control Busy bit (FCB bit in the Flow Control Register) to 1, or when the Rx FIFO is full, a pause frame is transmitted.

- If an application has requested flow control by setting the FCB bit in the Flow Control Register to 1, the MAC will generate and send a single pause frame. The pause time value in the generated frame is the pause time value programmed in the Flow Control Register. To extend or end the pause time before the time specified in the previously transmitted pause frame, the application program must configure the pause time value in the Flow Control Register to the appropriate value and, then, request another pause frame transmission.
- If the application has requested flow control when the Rx FIFO is full, the MAC will generate and transmit a pause frame. The value of the pause time of the generated frame is the pause time value programmed in the Flow Control Register. If the Rx FIFO remains full during the configurable interval, which is determined by the Pause Low Threshold bit (PLT) in the Flow Control Register before the pause time expires, a second pause frame will be transmitted. As long as the Rx FIFO remains full, the process repeats itself. If the FIFO is no longer full before the sample time, the MAC will send a pause frame with zero pause time, indicating to the remote end that the Rx buffer is ready to receive the new data frame.

10.2.1.2 Retransmission During a Collision

In half-duplex mode, a collision may occur on the MAC line interface when frames are transmitted to the MAC. The MAC may even give a status to indicate a retry before the end of the frame is received. The retransmission is then enabled and the frame is popped out from the FIFO. When more than 96 bytes are transmitted to the MAC core, the FIFO controller frees the space in the FIFO, allowing the DMA to push more data into FIFO. This means that data cannot be retransmitted after the threshold is exceeded or when the MAC core indicates that a late collision has occurred.

The MAC transmitter may abort the transmission of a frame because of collision, Tx FIFO underflow, loss of carrier, jabber timeout, no carrier, excessive deferral, and late collision. When frame transmission is aborted because of collision, the MAC requests retransmission of the frame.

10.2.2 Receive Operation

A receive operation is initiated when the MAC detects an SFD on the RMII or MII. The MAC strips the Preamble and SFD before processing the frame. The header fields are checked for the filtering and the FCS (Frame Check Sequence) field used to verify the CRC for the frame. The received frame is stored in a shallow buffer until the address filtering is performed. The frame is dropped in the MAC if it fails the address filtering.

The frame received by the MAC will be pushed into the Rx FIFO. Once the FIFO status exceeds the Receive Threshold, configured by the Receive Threshold Control (RTC) bit in the Operation Mode register, the DMA can initiate a preconfigured burst transmission to the AHB interface.

In the default pass-through mode, when the FIFO receives a complete packet or 64 bytes configured by the RTC bit in the Operation Mode Register, the data pops up and its availability is notified to the DMA. After the DMA initiates the transmission to the AHB interface, the data transmission continues from the FIFO until the complete

packet is transmitted. Upon completing transmitting the EOF, the status word will pop up and be transmitted to the DMA controller.

In the Rx FIFO Store-and-Forward mode (configured through the RSF or Receive Store and Forward bit in the Operation Mode Register), only the valid frames are read and forwarded to the application. In the passthrough mode, error frames are not discarded because the error status is received at the end of the frame. The start of frame will have been read from the FIFO at that point.

10.2.2.1 Reception Protocol

After the receive module receives the packets, the Preamble and SFD of the received frames are removed. When the SFD is detected, the MAC starts sending Ethernet frame data to the Rx FIFO, starting at the first byte (destination address) following the SFD. This timestamp is passed on to the application, unless the MAC filters out and drops the frame.

If the received frame length/type is less than 0x600 and the automatic CRC/Pad removal option is programmed for the MAC, the MAC will send frame data to the Rx FIFO (the amount of data does not exceed the number specified in the length/type field). Then MAC begins discarding the remaining section, including the FCS field. If the frame length/type is greater than, or equal to, 0x600, the MAC will send all received Ethernet frame data to the Rx FIFO, regardless of the programmed value of the automatic CRC removal option. By default, the MAC watchdog timer is enabled, meaning that frames, including DA, SA, LT, data, pad and FCS, which exceed 2048 bytes, are cut off. This function can be disabled by programming the Watchdog Disable (WD) bit in the MAC Configuration Register. However, even if the watchdog timer is disabled, frames longer than 16 KB will be cut off and the watchdog timeout status will be given.

10.2.2.2 Receive Frame Controller

If the RA (Receive All) bit in the MAC Frame Filter Register is reset, the MAC will filter frames based on the destination and source addresses. If the application decides not to receive any bad frames, such as runt frames and CRC error frames, another level of filtering is needed. When a frame fails the filtering, the frame is discarded and is not transmitted to the application. When the filter parameters are changed dynamically, if a frame fails the DA and SA filterings, the remaining part of the frame is discarded and the Receive Status word is updated immediately and, therefore, the zero frame length bit, CRC error bit, and runt frame error bit are set to 1. This indicates that the frame has failed the filtering.

10.2.2.3 Receive Flow Control

The MAC will detect the received pause frame and pause transmission of frames for a specified delay within the received pause frame (in full-duplex mode only). The Pause Frame Detect Function can be enabled or disabled by the RFCE (Receive Flow Control Enable) bit in the Flow Control Register. When receive flow control is enabled, it starts monitoring whether the destination address of the received frame matches the multicast address of the control frame (0x0180 C200 0001). If a match is detected (i.e. the destination address of the received frame matches the destination address of the reserved control frame), the MAC will determine whether to transmit the received control frame to the application, according to the PCF (Pass Control Frames) bit in the Frame Filter Register.

The MAC will also decode the type, the opcode, and the pause timer field of the Receive Control Frame. If the value of the status byte counter is 64 bits and there are no CRC errors, the MAC transmitter will halt the transmission of any data frame. The duration of the pause is the decoded pause time value multiplied by the interval (which is 64 bytes for both 10 Mbit/s and 100 Mb/s modes). At the same time, if another pause frame of zero pause time is detected, the MAC will reset the pause time to manage the new pause request.

If the type field (0x8808), the opcode (0x00001), and the byte length (64 bytes) of the received control frame are not 0x8808, 0x00001, and 64 bytes, respectively, or if there is a CRC error, the MAC will not generate a pause.

If a pause frame has a multicast destination address, the MAC filters the frame, according to the address matching.

For pause frames with a unicast destination address, the MAC checks whether the DA matches the content of the EMACADDR0 Register, and whether the Unicast Pause Frame Detect (UPFD) bit in the Flow Control Register is set to 1. The Pass Control Frames (PCF) bits in the Frame Filter Register [7:6] control the filtering of frames and addresses.

10.2.2.4 Reception of Multiple Frames

Since the status is available immediately after the data is received. Frames can be stored there, as long as the FIFO is not full.

10.2.2.5 Error Handling

If the Rx FIFO is full before receiving the EOF data from the MAC, an overflow will be generated and the entire frame will be discarded. In fact, status bit RDES0[11] will indicate that this frame is partial due to an overflow, and that it should be discarded.

If the function that corresponds to the Flush Transmit FIFO (FTF) bit and the Forward Undersized Good Frames (FUGF) bit in the Operation Mode Register is enabled, the Rx FIFO can filter error frames and runt frames. If the receive FIFO is configured to operate in store-and-forward mode, all error frames will be filtered and discarded.

In passthrough mode, if a frame's status and length are available when reading a SOF from the Rx FIFO, the entire error frame can be discarded. DMA can clear the error frame being read from the FIFO by enabling the Receive Frame Clear bit. The data transmission to the application (DMA) will then stop, and the remaining frames will be read internally and discarded. If FIFO is available, the transmission of the next frame will be initiated.

10.2.2.6 Receive Status Word

After receiving the Ethernet frames, the MAC outputs the receive status to the application. The detailed description of the receive status is the same as that which is configured by bit [31:0] in RDES0.

10.3 MAC Interrupt Controller

The MAC core can generate interrupts due to various events.

The interrupt register bits only indicate various interrupt events. To clear the interrupts, the corresponding status register and other registers must be read. An Interrupt Status Register describes the events that prompt the MAC core to generate interrupts. Each interrupt event can be prevented by setting the corresponding mask bit in the Interrupt Mask Register to 1. For example, if bit3 of the interrupt register is set high, it indicates that a magic packet or Wake-on-LAN frame has been received in Power-down mode. The PMT Control and Status register must be read to clear this interrupt event.

10.4 MAC Address Filtering

Address filtering will check the destination and source addresses of all received frames and report the address filtering status accordingly. For example, filtered frames can be identified either as multicast or broadcast. The address check, then, is based on the parameters selected by the application (Frame Filter Registers).

Physical (MAC) addresses are used for address checking during address filtering.

10.4.1 Unicast Destination Address Filtering

The MAC supports up to 8 MAC addresses for perfect filtering of unicast addresses. If a perfect filtering is selected (by resetting bit[1] in the Frame Filter Register), the MAC compares all 48 bits of the received unicast address with the programmed MAC address to determine if there is a match. By default, EMACADDR0 is always enabled, and the other addresses (EMACADDR0 ~ EMACADDR7) are selected by a separate enable bit. When the individual bytes of the other addresses (EMACADDR0 ~ EMACADDR7) are compared with the DA bytes received, the latter can be masked by setting the corresponding Mask Byte Control bit in the register to 1. This facilitates the DA group address filtering.

10.4.2 Multicast Destination Address Filtering

The MAC can be programmed to pass all multicast frames by setting the Pass All Multicast (PAM) bit in the Frame Filter Register to 1. If the PAM bit is reset, the MAC will filter multicast addresses, according to Bit[2] in the Frame Filter Register.

In perfect filtering mode, the multicast address is compared with the programmed MAC Destination Address Registers (EMACADDR0 ~ EMACADDR7). Group address filtering is also supported.

10.4.3 Broadcast Address Filtering

The MAC does not filter any broadcast frames in the default mode. However, if the MAC is programmed to reject all broadcast frames, which can happen by setting the Disable Broadcast Frames (DBF) bit in the Frame Filter Register to 1, all broadcast frames will be discarded.

10.4.4 Unicast Source Address Filtering

The MAC may also perform a perfect filtering based on the source address field of the received frame. By default, the Address Filtering Module (AFM) compares the Source Address (SA) field with the values programmed in the SA register. By setting Bit[30] in the SA register to 1, the MAC Address Register (EMACADDR0 - EMACADDR7) can be configured to contain SA, instead of Destination Address (DA), for filtering. Group filtering with SA is also supported. If the Source Address Filter (SAF) enable bit in the Frame Filter Register is set to 1, the MAC discards frames that do not pass the SA filtering. Otherwise, the result of SA filtering is given as a status bit in the Receive Status word (Please refer to Table 47).

When the SAF enable bit is set to 1, the result of the SA filtering and DA filtering is AND'ed to determine whether or not to forward the frame. Any frame that fails to pass will be discarded. Frames need to pass both filterings in order to be forwarded to the application.

10.4.5 Inverse Filtering Operation

For both destination address (DA) and source address (SA) filtering, you can invert the results matched through the filtering at the final output. The inverse filtering of DA and SA are controlled by the DAIF and SAIF bits, respectively, in the Frame Filter Register. The DAIF bit applies to both unicast and multicast DA frames. When DAIF is set to 1, the result of unicast or multicast destination address filtering will be inverted. Similarly, when the SAIF bit is set to 1, the result of unicast SA filtering is reversed.

The following two tables summarize the destination address and source address filtering, based on the type of the frames received.

Table 39: Destination Address Filtering

Frame Type	PM	PF	DAIF	PAM	DB	DA Filter Result
Broadcast	1	X	X	X	X	Pass
	0	X	X	X	0	Pass
	0	X	X	X	1	Fail
Unicast	1	X	X	X	X	All frames pass.
	0	X	0	X	X	Pass when results of perfect/group filtering match.
	0	X	1	X	X	Fail when results of perfect/group filtering match.
	0	1	0	X	X	Pass when results of perfect/group filtering match.
	0	1	1	X	X	Fail when results of perfect/group filtering match.
Multicast	1	X	X	X	X	All frames pass.
	X	X	X	1	X	All frames pass.
	0	X	0	0	X	Pass when results of perfect/group filtering match and pause control frame is discarded, if PCF = 0x.
	0	1	0	0	X	Pass when results of perfect/group filtering match and pause control frame is discarded, if PCF = 0x.
	0	X	1	0	X	Fail when results of perfect/group filtering match and pause control frame is discarded, if PCF = 0x.
	0	1	1	0	X	Fail when results of perfect/group filtering match and pause control frame is discarded, if PCF = 0x.
	0	1	1	0	X	Fail when results of perfect/group filtering match and pause control frame is discarded, if PCF = 0x.

The filtering parameters in the MAC Frame Filter Register described in Table 39 are as follows.

Parameter name:

PM: Pass All Multicast
 PF: Perfect Filter
 DAIF: Destination Address Inverse Filtering
 PAM: Pass All Multicast
 DB: Disable Broadcast Frames

Parameter setting:

1: Set
 0: Cleared

Table 40: Source Address Filtering

Frame Type	PM	SAIF	SAF	Source Address Filter Operation
Unicast	1	X	X	Pass all frames
	0	0	0	Pass when results of perfect/group filtering match. Frames not passed are not discarded.
	0	1	0	Fail when results of perfect/group filtering match. Frames not passed are not discarded.
	0	0	1	Pass when results of perfect/group filtering match. Frames not passed are discarded.
	0	1	1	Fail when results of perfect/group filtering match. Frames not passed are discarded.

The filtering parameters in the MAC Frame Filter Register described in Table 40 are as follows.

Parameter name:

PM: Pass All Multicast

SAF: Source Address Filtering

SAIF: Source Address Inverse Filtering

Parameter setting:

1: Set

0: Cleared

X: Don't care

10.4.6 Good Transmitted Frames and Received Frames

A frame successfully transmitted is considered a "good frame". In other words, a transmitted frame is considered to be good, if the frame transmission is not aborted due to the following errors:

- Jabber timeout
- No carrier or loss of carrier
- Late collision
- Frame underflow
- Excessive deferral
- Excessive collision

The received frames are considered "good frames", if there are not any of the following errors:

- CRC error
- Runt frames (frames shorter than 64 bytes)
- Alignment error (in 10/100 Mbps modes only)
- Length error (non-type frames only)
- Frame size over the maximum size (for non-type frames over the maximum frame size only)
- MII_RXER input error

The maximum frame size depends on the frame type:

- The maximum size of untagged frames = 1518 bytes
- The maximum size of VLAN frames = 1522 bytes

10.5 EMAC_MTL (MAC Transaction Layer)

The MAC Transaction Layer provides FIFO memory to buffer and regulates the frames between the application system memory and the MAC. It also enables the data to be transmitted between the application clock domain and the MAC clock domains. The MTL layer has two data paths, namely the Transmit path and the Receive path. The data path for both directions is 32-bit wide and operates with a simple FIFO protocol.

10.6 PHY Interface

The DMA and the Host driver communicate through two data structures:

- Control and Status Registers (CSR)
- Descriptor lists and data buffers

For details please refer to [Register Summary](#) and [Linked List Descriptors](#).

10.6.1 MII (Media Independent Interface)

Media Independent Interface (MII) defines the interconnection between MAC sublayers and PHYs at the data transmission rate of 10 Mbit/s and 100 Mbit/s.

10.6.1.1 Interface Signals Between MII and PHY

Interface signals between MII and PHY are shown in Figure 41.

Figure 41: MII Interface

MII Interface Signal Description:

- **MII_TX_CLK**: TX clock signal. This signal provides the reference timing for TX data transmission. The frequencies are divided into two types: 2.5 MHz at a data transmission rate of 10 Mbit/s, and 25 MHz at 100 Mbit/s.
- **MII_TXD[3:0]**: Transmit data signal in groups of four, syn-driven by the MAC sub-layer, and valid only when the MII_TX_EN signal is valid. MII_TXD[0] is the lowest significant bit and MII_TXD[3] is the highest significant bit. When the signal MII_TX_EN is pulled low, sending data does not have any effect on the PHY.

- **MII_TX_EN**: Transmit data enable signal. This signal indicates that the MAC is currently sending nibbles (4 bits) for the MII. This signal must be synchronized with the first nibble of the header (**MII_TX_CLK**) and must be synchronized when all nibbles to be transmitted are sent to the MII.
- **MII_RX_CLK**: RX clock signal. This signal provides the reference timing for RX data transmission. The frequencies are divided into two types: 2.5 MHz at the data transmission rate of 10 Mbit/s, and 25 MHz at 100 Mbit/s.
- **MII_RXD[3:0]**: Receive data signal in groups of four, syn-driven by the PHY, and valid only when **MII_RX_DV** signal is valid. **MII_RXD[0]** is the lowest significant bit and **MII_RXD[3]** is the highest significant bit. When **MII_RX_DV** is disabled and **MII_RX_ER** is enabled, the specific **MII_RXD[3:0]** value represents specific information from the PHY.
- **MII_RX_DV**: Receive data valid signal. This signal indicates that the PHY is currently receiving the recovered and decoded nibble that will be transmitted to the MII. This signal must be synchronized with the first nibble of the recovered frame (**MII_RX_CLK**) and remain synchronized till the last nibble of the recovered frame. This signal must be disabled before the first clock cycle following the last nibble. In order to receive the frame correctly, the **MII_RX_DV** signal must cover the frame to be received over the time range, starting no later than when the SFD field appears.
- **MII_CRD**: Carrier sense signal. When the transmitting or receiving medium is in the non-idle state, the signal is enabled by the PHY. When the transmitting or receiving medium is in the idle state, the signal is disabled by the PHY. The PHY must ensure that the **MII_CRD** signal remains valid under conflicting conditions. This signal does not need to be synchronized with the TX and RX clocks. In full-duplex mode, this signal is insignificant.
- **MII_COL**: Collision detection signal. After a collision is detected on the medium, the PHY must immediately enable the collision detection signal, and the collision detection signal must remain active as long as a condition for collision exists. This signal does not need to be synchronized with the TX and RX clocks. In full-duplex mode, this signal is meaningless.
- **MII_RX_ER**: Receive error signal. The signal must remain for one or more cycles (**MII_RX_CLK**) to indicate to the MAC sublayer that an error has been detected somewhere in the frame.
- **MDIO** and **MDC**: Management Data Input/Output and Management Data Clock. The two signals constitute a serial bus defined for the Ethernet family of IEEE 802.3 standards, used to transfer control and data information to the PHY, see section [Station Management Agent \(SMA\) Interface](#).

10.6.1.2 MII Clock

In MII mode, there are two directions of clock, Tx and Rx clocks in the interface between MII and the PHY. **MII_TX_CLK** is used to synchronize the TX data, and **MII_RX_CLK** is used to synchronize the RX data. The **MII_RX_CLK** clock is provided by the PHY. The **MII_TX_CLK** is provided by the chip's internal PLL or external crystal oscillator. For details regarding Figure 42, please refer to the clock-related registers in [Register Summary](#).

Figure 42: MII Clock

10.6.2 RMII (Reduced Media-Independent Interface)

RMII interface signals are shown in figure 43.

Figure 43: RMII Interface

10.6.2.1 RMII Interface Signal Description

The Reduced Media-Independent Interface (RMII) specification reduces the number of pins between the microcontroller's external peripherals and the external PHY at a data transmission rate of 10 Mbit/s or 100 Mbit/s. According to the IEEE 802.3u standard, MII includes 16 pins that contain data and control signals. The RMII specification reduces 62.5% of the pins to the number of seven.

RMII has the following features:

- Support for an operating rate of 10 Mbit/s or 100 Mbit/s
- The reference clock frequency must be 50 MHz.

- The same reference clock must be provided externally both to the MAC and the external Ethernet PHY. It provides independent 2-bit-wide Tx and Rx data paths.

10.6.2.2 RMII Clock

The configuration of the RMII clock is as figure 44 shows.

Figure 44: RMII Clock

10.6.3 Station Management Agent (SMA) Interface

As Figure 42 shows, the MAC uses MDC and MDIO signals to transfer control and data information to the PHY. The maximum clock frequency is 2.5 MHz. The clock is generated from the application clock by a clock divider. The PHY transmits register data during a write/read operation through the MDIO. This signal is driven synchronously to the MDC clock.

Please refer to [Register Summary](#) for details about the EMII Address Register and the EMII Data Register.

10.7 Ethernet DMA Features

The DMA has independent Transmit and Receive engines, and a CSR (Control and Status Registers) space. The Transmit engine transfers data from the system memory to the device port (MTL), while the Receive engine transmits data from the device port to the system memory. The controller uses descriptors to efficiently move data from source to destination with minimal Host CPU intervention. The DMA is designed for packet-oriented data transmission, such as frames in Ethernet. The controller can be programmed to interrupt the Host CPU for normal situations, such as the completion of frame transmission or reception, or when errors occur.

10.8 Linked List Descriptors

This section shows the structure of the linked lists and the descriptors. Every linked list consists of eight words.

10.8.1 Transmit Descriptors

The structure of the transmitter linked lists is shown in Figure 45. Table 41 to Table 46 show the description of the linked lists.

Figure 45: Transmit Descriptor

Table 41: Transmit Descriptor 0 (TDES0)

Bits	Name	Description
[31]	OWN: Own Bit	When set, this bit indicates that the descriptor is owned by the DMA. When this bit is reset, it indicates that the descriptor is owned by the Host. The DMA clears this bit, either when it completes the frame transmission or when the buffers allocated to the descriptor are empty. The ownership bit of the First Descriptor of the frame should be set after all subsequent descriptors belonging to the same frame have been set. This avoids a possible race condition between fetching a descriptor and the driver setting an ownership bit.
[30]	IC: Interrupt on Completion	When set, this bit sets the Transmit Interrupt (Register 5[0]) after the present frame has been transmitted. This bit is valid only when the last segment bit (TDES0[29]) is set.
[29]	LS: Last Segment	When set, this bit indicates that the buffer contains the last segment of the frame. When this bit is set, the TBS1 or TBS2 field in TDES1 should have a non-zero value.
[28]	FS: First Segment	When set, this bit indicates that the buffer contains the first segment of a frame.
[27]	DC: Disable CRC	When this bit is set, the MAC does not append a cyclic redundancy check (CRC) to the end of the transmitted frame. This is valid only when the first segment (TDES0[28]) is set.

Bits	Name	Description
[26]	DP: Disable Pad	When set, the MAC does not automatically add padding to a frame shorter than 64 bytes. When this bit is reset, the DMA automatically adds padding and CRC to a frame shorter than 64 bytes, and the CRC field is added despite the state of the DC (TDES0[27]) bit. This is valid only when the first segment (TDES0[28]) is set.
[25]	TTSE: Transmit Timestamp Enable	When set, this bit enables IEEE1588 hardware timestamping for the transmit frame referenced by the descriptor. This field is valid only when the First Segment control bit (TDES0[28]) is set.
[24]	CRCR: CRC Replacement Control	When set, the MAC replaces the last four bytes of the transmitted packet with recalculated CRC bytes. The host should ensure that the CRC bytes are present in the frame being transmitted from the Transmit Buffer. This bit is valid when the First Segment control bit (TDES0[28]) is set. In addition, CRC replacement is done only when Bit TDES0[27] is set to 1.
[23:22]	CIC: Checksum Insertion Control	These bits control the checksum calculation and insertion. The following list describes the bit encoding: • 2'b00: Checksum insertion is disabled. • 2'b01: Only IP header checksum calculation and insertion are enabled. • 2'b10: IP header checksum and payload checksum calculation and insertion are enabled, but pseudo-header checksum is not calculated in hardware. • 2'b11: IP Header checksum and payload checksum calculation and insertion are enabled, and pseudo-header checksum is calculated in hardware. This field is valid when the First Segment control bit (TDES0[28]) is set.
[21]	TER: Transmit End of Ring	When set, this bit indicates that the descriptor list reached its final descriptor. The DMA returns to the base address of the list, creating a Descriptor Ring.
[20]	TCH: Second Address Chained	When set, this bit indicates that the second address in the descriptor is the Next Descriptor address, rather than the second buffer address. When TDES0[20] is set, TBS2 (TDES1[28:16]) is a “don't care” value. TDES0[21] takes precedence over TDES0[20]. This bit should be set to 1.

Bits	Name	Description
[19:18]	VLIC: VLAN Insertion Control	When set, these bits request the MAC to perform VLAN tagging or untagging before transmitting the frames. If the frame is modified for VLAN tags, the MAC automatically recalculates and replaces the CRC bytes. The following list describes the values of these bits: • 2'b00: Do not add a VLAN tag. • 2'b01: Remove the VLAN tag from the frames before transmission. This option should be used only with the VLAN frames. • 2'b10: Insert a VLAN tag with the tag value programmed in VLAN Tag Inclusion or Replacement Register. • 2'b11: Replace the VLAN tag in frames with the Tag value programmed in VLAN Tag Inclusion or Replacement Register. This option should be used only with the VLAN frames.
[17]	TTSS: Transmit Timestamp Status	This field is used as a status bit to indicate that a timestamp was captured for the described transmit frame. When this bit is set, TDES2 and TDES3 have a timestamp value captured for the transmit frame. This field is only valid when the descriptor's Last Segment control bit (TDES0[29]) is set.
[16]	IHE: IP Header Error	When set, this bit indicates that the MAC transmitter detected an error in the IP datagram header. The transmitter checks the header length in the IPv4 packet against the number of header bytes received from the application, and indicates an error status if there is a mismatch. For IPv6 frames, a header error is reported if the main header length is not 40 bytes. Furthermore, the Ethernet Length/Type field value for an IPv4 or IPv6 frame must match the IP header version received with the packet. For IPv4 frames, an error status is also indicated if the Header Length field has a value less than 0x5.
[15]	ES: Error Summary	Indicates the logical OR of the following bits: • TDES0[14]: Jabber Timeout • TDES0[13]: Frame Flush • TDES0[11]: Loss of Carrier • TDES0[10]: No Carrier • TDES0[9]: Late Collision • TDES0[8]: Excessive Collision • TDES0[2]: Excessive Deferral • TDES0[1]: Underflow Error • TDES0[16]: IP Header Error • TDES0[12]: IP Payload Error
[14]	JT: Jabber Timeout	When set, this bit indicates the MAC transmitter has experienced a jabber timeout. This bit is only set when EMACCONFIG_REG's bit EMACJABBER is not set.
[13]	FF: Frame Flushed	When set, this bit indicates that the DMA or MTL flushed the frame because of a software Flush command given by the CPU.

Bits	Name	Description
[12]	IPE: IP Payload Error	When set, this bit indicates that MAC transmitter detected an error in the TCP, UDP, or ICMP IP datagram payload. The transmitter checks the payload length received in the IPv4 or IPv6 header against the actual number of TCP, UDP, or ICMP packet bytes received from the application, and issues an error status in case of a mismatch.
[11]	LOC: Loss of Carrier	When set, this bit indicates that a loss of carrier occurred during frame transmission (that is, the MII_CRS signal was inactive for one or more transmit clock periods during frame transmission). This is valid only for the frames transmitted without collision when the MAC operates in the half-duplex mode.
[10]	NC: No Carrier	When set, this bit indicates that the Carrier Sense signal from the PHY was not asserted during transmission.
[9]	LC: Late Collision	When set, this bit indicates that frame transmission is aborted because of a collision occurring after the collision window (64 byte-times including Preamble in MII mode, and 512 byte-times including Preamble and Carrier Extension). This bit is not valid if the Underflow Error bit is set.
[8]	EC: Excessive Collision	When set, this bit indicates that the transmission was aborted after 16 successive collisions while attempting to transmit the current frame. If bit EMACRETRY of EMACCONFIG_REG is set, this bit is set after the first collision, and the transmission of the frame is aborted.
[7]	VF: VLAN Frame	When set, this bit indicates that the transmitted frame is a VLAN-type frame.
[6:3]	Ctrl/status	These status bits indicate the number of collisions that occurred before the frame was transmitted. This count is not valid when the Excessive Collisions bit (TDES0[8]) is set. The core updates this status field only in the half-duplex mode.
[2]	ED: Excessive Deferral	When set, this bit indicates that the transmission has ended because of excessive deferral of over 24,288 bit times (if Jumbo Frame is enabled) if bit EMACDEFERRAL of EMACCONFIG_REG is set high.
[1]	UF: Underflow Error	When set, this bit indicates that the MAC aborted the frame because the data arrived late from the Host memory. Underflow Error indicates that the DMA encountered an empty transmit buffer while transmitting the frame. The transmission process enters the Suspended state and sets both Bit[5] in Transmit Underflow Register (Status Register) and Bit[0] in Transmit Interrupt Register (Status Register).
[0]	DB: Deferred Bit	When set, this bit indicates that the MAC defers before transmission because of the presence of a carrier. This bit is valid only in the half-duplex mode.

Table 42: Transmit Descriptor 1 (TDES1)

Bits	Name	Description
[31:29]	SAIC: SA Insertion Control	These bits request the MAC to add or replace the Source Address field in the Ethernet frame with the value given in the MAC Address 0 register. If the Source Address field is modified in a frame, the MAC automatically recalculates and replaces the CRC bytes. The Bit[31] specifies the MAC Address Register value (1 or 0) that is used for Source Address insertion or replacement. The following list describes the values of Bits[30:29]: • 2'b00: Do not include the source address. • 2'b01: Include or insert the source address. For reliable transmission, the application must provide frames without source addresses. • 2'b10: Replace the source address. For reliable transmission, the application must provide frames with source addresses. • 2'b11: Reserved These bits are valid when the First Segment control bit (TDES0[28]) is set.
[28:16]	Reserved	Reserved
[15:13]	Reserved	Reserved
[12:0]	TBS1: Transmit Buffer 1 Size	These bits indicate the data buffer byte size in bytes. If this field is 0, the DMA ignores this buffer and uses Buffer 2 or the next descriptor.

Table 43: Transmit Descriptor 2 (TDES2)

Bits	Name	Description
[31:0]	Buffer 1 Address Pointer	These bits indicate the physical address of Buffer 1.

Table 44: Transmit Descriptor 3 (TDES3)

Bits	Name	Description
[31:0]	Next Descriptor Address	This address contains the pointer to the physical memory where the Next Descriptor is present.

Table 45: Transmit Descriptor 6 (TDES6)

Bits	Name	Description
[31:0]	TTSL: Transmit Frame Timestamp Low	This field is updated by DMA with the least significant 32 bits of the timestamp captured for the corresponding transmit frame. This field has the timestamp only if the Last Segment (LS) bit in the descriptor is set, and the Timestamp Status (TTSS) bit is set too.

Table 46: Transmit Descriptor 7 (TDES7)

Bits	Name	Description
[31:0]	TTSH: Transmit Frame Timestamp High	This field is updated by DMA with the most significant 32 bits of the timestamp captured for the corresponding receive frame. This field has the timestamp only if the Last Segment (LS) bit in the descriptor is set, and the Timestamp Status (TTSS) bit is set too.

10.8.2 Receive Descriptors

The structure of the receiver linked lists is shown in Figure 46. Table 47 to Table 53 provide the description of the linked lists.

Figure 46: Receive Descriptor

Table 47: Receive Descriptor 0 (RDES0)

Bits	Name	Description
[31]	OWN: Own Bit	When set, this bit indicates that the descriptor is owned by the DMA of the DWC_gmac. When this bit is reset, it indicates that the descriptor is owned by the Host. The DMA clears this bit either when it completes the frame reception or when the buffers that are associated with this descriptor are full.
[30]	AFM: Destination Address Filter Fail	When set, this bit indicates a frame that failed in the DA Filter in the MAC.
[29:16]	FL: Frame Length	These bits indicate the byte length of the received frame that was transmitted to host memory. This field is valid when Last Descriptor (RDES0[8]) is set and either the Descriptor Error (RDES0[14]) or Overflow Error bits is reset. The frame length also includes the two bytes appended to the Ethernet frame when IP checksum calculation (Type 1) is enabled and the received frame is not a MAC control frame.
[15]	ES: Error Summary	Indicates the logical OR of the following bits: • RDES0[1]: CRC Error • RDES0[3]: Receive Error • RDES0[4]: Watchdog Timeout • RDES0[6]: Late Collision • RDES0[7]: Giant Frame • RDES4[4:3]: IP Header or Payload Error • RDES0[11]: Overflow Error • RDES0[14]: Descriptor Error This field is valid only when the Last Descriptor (RDES0[8]) is set.
[14]	DE: Descriptor Error	When set, this bit indicates a frame truncation caused by a frame that does not fit within the current descriptor buffers, and that the DMA does not own the Next Descriptor. The frame is truncated. This field is valid only when the Last Descriptor (RDES0[8]) is set.

Bits	Name	Description
[13]	SAF: Source Address Filter Fail	When set, this bit indicates that the SA field of frame failed the SA Filter in the MAC.
[12]	LE: Length Error	When set, this bit indicates that the actual length of the frame received and that the Length/Type field does not match. This bit is valid only when the Frame Type (RDES0[5]) bit is reset.
[11]	OE: Overflow Error	When set, this bit indicates that the received frame was damaged because of buffer overflow in MTL.
[10]	VLAN: VLAN Tag	When set, this bit indicates that the frame to which this descriptor is pointing is a VLAN frame tagged by the MAC. The VLAN tagging depends on checking the VLAN fields of the received frame based on the Register (VLAN Tag Register) settings.
[9]	FS: First Descriptor	When set, this bit indicates that this descriptor contains the first buffer of the frame. If the size of the first buffer is 0, the second buffer contains the beginning of the frame. If the size of the second buffer is also 0, the next Descriptor contains the beginning of the frame.
[8]	LS: Last Descriptor	When set, this bit indicates that the buffers pointed to by this descriptor are the last buffers of the frame.
[7]	Timestamp Available, IP Checksum Error (Type1), or Giant Frame	When the Advanced Timestamp feature is present, and when this bit set, it indicates that a snapshot of the Timestamp is written in descriptor words 6 (RDES6) and 7 (RDES7). This is valid only when the Last Descriptor bit (RDES0[8]) is set. When IP Checksum Engine (Type 1) is selected, this bit, if set, indicates one of the following: • The 16-bit IPv4 header checksum calculated by the core did not match the received checksum bytes. • The header checksum checking is bypassed for non-IPv4 frames. Otherwise, this bit, when set, indicates the Giant Frame Status. Giant frames are larger than 1,518 bytes (or 1,522 bytes for VLAN or 2,000 bytes when Bit[27] of the MAC Configuration register is set), normal frames and larger-than-9,018-byte (9,022-byte for VLAN) frames when Jumbo Frame processing is enabled.
[6]	LC: Late Collision	When set, this bit indicates that a late collision has occurred while receiving the frame in the half-duplex mode.
[5]	FT: Frame Type	When set, this bit indicates that the Receive Frame is an Ethernet-type frame (the LT field is greater than, or equal to, 1,536). When this bit is reset, it indicates that the received frame is an IEEE 802.3 frame. This bit is not valid for Runt frames which are less than 14 bytes.
[4]	RWT: Receive Watchdog Timeout	When set, this bit indicates that the Receive Watchdog Timer has expired while receiving the current frame and the current frame is truncated after the Watchdog Timeout.
[3]	RE: Receive Error	When set, this bit indicates that the MII_RXER signal is asserted while MII_RXDV is asserted during frame reception.

Bits	Name	Description
[2]	DE: Dribble Bit Error	When set, this bit indicates that the received frame has a non-integer multiple of bytes (odd nibbles). This bit is valid only in the MII Mode.
[1]	CE: CRC Error	When set, this bit indicates that a Cyclic Redundancy Check (CRC) Error occurred on the received frame. This field is valid only when the Last Descriptor (RDES0[8]) is set.
[0]	Extended Status Available/ Rx MAC Address	When either Advanced Timestamp or IP Checksum Offload (Type 2) is present, this bit, when set, indicates that the extended status is available in descriptor word 4 (RDES4). This is valid only when the Last Descriptor bit (RDES0[8]) is set. This bit is invalid when Bit 30 is set. When IP Checksum Offload (Type 2) is present, this bit is set even when the IP Checksum Offload engine bypasses the processing of the received frame. The bypassing may be because of a non-IP frame or an IP frame with a non-TCP/UDP/ICMP payload. When the Advance Timestamp Feature or the IPC Full Offload is not selected, this bit indicates an Rx MAC Address status. When set, this bit indicates that the Rx MAC Address registers value (1 to 15) matched the frame's DA field. When reset, this bit indicates that the Rx MAC Address Register 0 value matched the DA field.

Table 48: Receive Descriptor 1 (RDES1)

Bits	Name	Description
[31]	Ctrl	When set, this bit prevents setting the Status Register's RI bit (CSR5[6]) for the received frame that ends in the buffer indicated by this descriptor. This, in turn, disables the assertion of the interrupt to Host because of the RI for that frame.
[30:29]	Reserved	Reserved
[28:16]	Reserved	Reserved
[15]	RER: Receive End of Ring	When set, this bit indicates that the descriptor list reached its final descriptor. The DMA returns to the base address of the list, creating a Descriptor Ring.
[14]	RCH: Second Address Chained	When set, this bit indicates that the second address in the descriptor is the Next Descriptor address rather than the second buffer address. When this bit is set, RBS2 (RDES1[28:16]) is a "don't care" value. RDES1[15] takes precedence over RDES1[14].
[13]	Reserved	Reserved
[12:0]	RBS1: Receive Buffer 1 Size	Indicates the first data buffer size in bytes. The buffer size must be a multiple of 4, even if the value of RDES2 (buffer1 address pointer) is not aligned to bus width. When the buffer size is not a multiple of 4, the resulting behavior is undefined. If this field is 0, the DMA ignores this buffer and uses Buffer 2 or the next descriptor depending on the value of RCH (Bit[14]).

Table 49: Receive Descriptor 2 (RDES2)

Bits	Name	Description
[31:0]	Buffer 1 Address Pointer	These bits indicate the physical address of Buffer 1.

Table 50: Receive Descriptor 3 (RDES3)

Bits	Name	Description
[31:0]	Next Descriptor Address	This address contains the pointer to the physical memory where the Next Descriptor is present.

Table 51: Receive Descriptor 4 (RDES4)

Bits	Name	Description
[31:28]	Reserved	Reserved
[27:26]	Reserved	Reserved
[25]	Reserved	Reserved
[24]	Reserved	Reserved
[23:21]	Reserved	Reserved
[20:18]	Reserved	Reserved
[17]	Reserved	Reserved
[16]	Reserved	Reserved
[15]	Reserved	Reserved
[14]	Timestamp Dropped	When set, this bit indicates that the timestamp was captured for this frame but got dropped in the MTL Rx FIFO because of an overflow.
[13]	PTP Version	When set, this bit indicates that the received PTP message is having the IEEE 1588 version 2 format. When reset, it has the version 1 format.
[12]	PTP Frame Type	When set, this bit indicates that the PTP message is sent directly over the Ethernet. When this bit is not set and the message type is non-zero, it indicates that the PTP message is sent over UDP-IPv4 or UDP-IPv6. The information about IPv4 or IPv6 can be obtained from Bits 6 and 7.

Bits	Name	Description
[11:8]	Message Type	These bits are encoded to give the type of the message received. • 3'b0000: No PTP message received • 3'b0001: SYNC (all clock types) • 3'b0010: Follow_Up (all clock types) • 3'b0011: Delay_Req (all clock types) • 3'b0100: Delay_Resp (all clock types) • 3'b0101: Pdelay_Req (in peer-to-peer transparent clock) • 3'b0110: Pdelay_Resp (in peer-to-peer transparent clock) • 3'b0111: Pdelay_Resp_Follow_Up (in peer-to-peer transparent clock) • 3'b1000: Announce • 3'b1001: Management • 3'b1010: Signaling • 3'b1011-3'b1110: Reserved • 3'b1111: PTP packet with Reserved message type
[7]	IPv6 Packet Received	When set, this bit indicates that the received packet is an IPv6 packet. This bit is updated only when Bit[10] (IPC) of Register (MAC Configuration Register) is set.
[6]	IPv4 Packet Received	When set, this bit indicates that the received packet is an IPv4 packet. This bit is updated only when Bit[10] (IPC) of Register (MAC Configuration Register) is set.
[5]	IP Checksum Bypassed	When set, this bit indicates that the checksum offload engine is bypassed.
[4]	IP Payload Error	When set, this bit indicates that the 16-bit IP payload checksum (that is, the TCP, UDP, or ICMP checksum) that the core calculated does not match the corresponding checksum field in the received segment. It is also set when the TCP, UDP, or ICMP segment length does not match the payload length value in the IP Header field. This bit is valid when either Bit 7 or Bit 6 is set.
[3]	IP Header Error	When set, this bit indicates that either the 16-bit IPv4 header checksum calculated by the core does not match the received checksum bytes, or the IP datagram version is not consistent with the Ethernet Type value. This bit is valid when either Bit[7] or Bit[6] is set.
[2:0]	IP Payload Type	These bits indicate the type of payload encapsulated in the IP datagram processed by the Receive Checksum Offload Engine (COE). The COE also sets these bits to 2'b00 if it does not process the IP datagram's payload due to an IP header error or fragmented IP. • 3'b000: Unknown or did not process IP payload • 3'b001: UDP • 3'b010: TCP • 3'b011: ICMP • 3'b1xx: Reserved This bit is valid when either Bit[7] or Bit[6] is set.

Table 52: Receive Descriptor 6 (RDES6)

Bits	Name	Description
[31:0]	RTSH: Receive Frame Timestamp Low	This field is updated by DMA with the least significant 32 bits of the timestamp captured for the corresponding receive frame. This field is updated by DMA only for the last descriptor of the receive frame which is indicated by the Last Descriptor status bit (RDES0[8]).

Table 53: Receive Descriptor 7 (RDES7)

Bits	Name	Description
[31:0]	RTSH: Receive Frame Timestamp High	This field is updated by DMA with the most significant 32 bits of the timestamp captured for the corresponding receive frame. This field is updated by DMA only for the last descriptor of the receive frame which is indicated by the Last Descriptor status bit (RDES0[8]).

10.9 Register Summary

Note that specific fields or bits of a given register may have different access attributes. Below is the list of all attributes together with the abbreviations used in register descriptions.

- Read Only (RO)
- Write Only (WO)
- Read and Write (R/W)
- Read, Write, and Self Clear (R/W/SC)
- Read, Self Set, and Write Clear (R/SS/WC)
- Read, Write Set, and Self Clear (R/WS/SC)
- Read, Self Set, and Self Clear or Write Clear (R/SS/SC/WC)
- Read Only and Write Trigger (RO/WT)
- Read, Self Set, and Read Clear (R/SS/RC)
- Read, Write, and Self Update (R/W/SU)
- Latched-low (LL)
- Latched-high (LH)

Name	Description	Address	Access
DMA configuration and control registers			
DMABUSMODE_REG	Bus mode configuration	0x60029000	R/WS/SC
DMATXPOLLDemand_REG	Pull demand for data transmit	0x60029004	RO/WT
DMARXPOLLDemand_REG	Pull demand for data receive	0x60029008	RO/WT
DMARXBASEADDR_REG	Base address of the first receive descriptor	0x6002900C	R/W

Name	Description	Address	Access
DMATXBASEADDR_REG	Base address of the first transmit descriptor	0x60029010	R/W
DMASTATUS_REG	State of interrupts, errors and other events	0x60029014	R/SS/WC
DMAIN_EN_REG	Enable / disable interrupts	0x6002901C	R/W
DMARINTWDTIMER_REG	Watchdog timer count on receive	0x60029024	R/W
DMATXCURRDESC_REG	Pointer to current transmit descriptor	0x60029048	RO
DMARXCURRDESC_REG	Pointer to current receive descriptor	0x6002904C	RO
DMATXCURRADDR_BUF_REG	Pointer to current transmit buffer	0x60029050	RO
DMARXCURRADDR_BUF_REG	Pointer to current receive buffer	0x60029054	RO
MAC configuration and control registers			
EMACCONFIG_REG	MAC configuration	0x6002A000	R/W
EMACFF_REG	Frame filter settings	0x6002A004	R/W
EMACMIADDR_REG	PHY configuration access	0x6002A010	R/WS/SC
EMACMIIDATA_REG	PHY data read write	0x6002A014	R/W
EMACFC_REG	frame flow control	0x6002A018	R/WS/SC(FCB) R/W(BPA)
EMACDEBUG_REG	Status debugging bits	0x6002A024	RO
EMACINTS_REG	Interrupt status	0x6002A038	RO
EMACINTMASK_REG	Interrupt mask	0x6002A03C	R/W
EMACADDR0HIGH_REG	Upper 16 bits of the first 6-byte MAC address	0x6002A040	R/W
EMACADDR0LOW_REG	Lower 32 bits of the first 6-byte MAC address	0x6002A044	R/W
EMACADDR1HIGH_REG	MAC address filtering and upper 16 bits of the second 6-byte MAC address	0x6002A048	R/W
EMACADDR1LOW_REG	Lower 32 bits of the second 6-byte MAC address	0x6002A04C	R/W
EMACADDR2HIGH_REG	MAC address filtering and upper 16 bits of the third 6-byte MAC address	0x6002A050	R/W
EMACADDR2LOW_REG	Lower 32 bits of the third 6-byte MAC address	0x6002A054	R/W
EMACADDR3HIGH_REG	MAC address filtering and upper 16 bits of the fourth 6-byte MAC address	0x6002A058	R/W
EMACADDR3LOW_REG	Lower 32 bits of the fourth 6-byte MAC address	0x6002A05C	R/W
EMACADDR4HIGH_REG	MAC address filtering and upper 16 bits of the fifth 6-byte MAC address	0x6002A060	R/W
EMACADDR4LOW_REG	Lower 32 bits of the fifth 6-byte MAC address	0x6002A064	R/W
EMACADDR5HIGH_REG	MAC address filtering and upper 16 bits of the sixth 6-byte MAC address	0x6002A068	R/W
EMACADDR5LOW_REG	Lower 32 bits of the sixth 6-byte MAC address	0x6002A06C	R/W

Name	Description	Address	Access
EMACADDR6HIGH_REG	MAC address filtering and upper 16 bits of the seventh 6-byte MAC address	0x6002A070	R/W
EMACADDR6LOW_REG	Lower 32 bits of the seventh 6-byte MAC address	0x6002A074	R/W
EMACADDR7HIGH_REG	MAC address filtering and upper 16 bits of the eighth 6-byte MAC address	0x6002A078	R/W
EMACADDR7LOW_REG	Lower 32 bits of the eighth 6-byte MAC address	0x6002A07C	R/W
EMAC_AN_CONTROL_REG	Auto negotiation control	0x6002A0C0	R/WS/SC
EMAC_AN_STATUS_REG	Auto negotiation status	0x6002A0C4	RO
EMACCSTATUS_REG	Link communication status	0x6002A0D8	RO
EMACWDOGTO_REG	Watchdog timeout control	0x6002A0DC	R/W
Clock configuration registers			
EMAC_EX_CLKOUT_CONF_REG	RMII clock divider setting	0x60029800	R/W
EMAC_EX_OSCCLK_CONF_REG	RMII clock half and whole divider settings	0x60029804	R/W
EMAC_EX_CLK_CTRL_REG	Clock enable and external / internal clock selection	0x60029808	R/W
PHY type and SRAM configuration registers			
EMAC_EX_PHYINF_CONF_REG	Selection of MII / RMII phy	0x6002980C	R/W
EMAC_PD_SEL_REG	Ethernet RAM power-down enable	0x60029810	R/W

10.10 Registers

Note: The value of all reset registers must be set to the reset value.

Register 10.1: DMABUSMODE_REG (0x0000)

(reserved)					DMAMXEDBURST DMAADDRALIBEA PBLX8_MODE USE_SEP_PBL				RX_DMA_PBL				FIXED_BURST PRI_RATIO				PROG_BURST_LEN				ALT_DESC_SIZE				DESC_SKIP_LEN				DMA_ARB_SCH SW_RST			
31		27	26	25	24	23	22		17	16	15	14	13		8	7	6		2	1	0											
0	0	0	0	0	0	0	0	0x01	0	0x0		0x01		0	0x00		0	1	Reset													

DMAMIXEDBURST When this bit is set high and the FB bit is low, the AHB master interface starts all bursts of a length more than 16 with INCR (undefined burst), whereas it reverts to fixed burst transfers (INCRx and SINGLE) for burst length of 16 and less. (R/W)

DMAADDRALIBEA When this bit is set high and the FB bit is 1, the AHB interface generates all bursts aligned to the start address LS bits. If the FB bit is 0, the first burst (accessing the start address of data buffer) is not aligned, but subsequent bursts are aligned to the address. (R/W)

PBLX8_MODE When set high, this bit multiplies the programmed PBL value (Bits[22:17] and Bits[13:8]) eight times. Therefore, the DMA transfers the data in 8, 16, 32, 64, 128, and 256 beats depending on the PBL value. (R/W)

USE_SEP_PBL When set high, this bit configures the Rx DMA to use the value configured in Bits[22:17] as PBL. The PBL value in Bits[13:8] is applicable only to the Tx DMA operations. When reset to low, the PBL value in Bits[13:8] is applicable for both DMA engines. (R/W)

RX_DMA_PBL This field indicates the maximum number of beats to be transferred in one Rx DMA transaction. This is the maximum value that is used in a single block Read or Write. The Rx DMA always attempts to burst as specified in the RPBL bit each time it starts a burst transfer on the host bus. You can program RPBL with values of 1, 2, 4, 8, 16, and 32. Any other value results in undefined behavior. This field is valid and applicable only when USP is set high. (R/W)

FIXED_BURST This bit controls whether the AHB master interface performs fixed burst transfers or not. When set, the AHB interface uses only SINGLE, INCR4, INCR8, or INCR16 during start of the normal burst transfers. When reset, the AHB interface uses SINGLE and INCR burst transfer operations. (R/W)

PRI_RATIO These bits control the priority ratio in the weighted round-robin arbitration between the Rx DMA and Tx DMA. These bits are valid only when Bit 1 (DA) is reset. The priority ratio Rx:Tx represented by each bit: (R/W)

- 2'b00 — 1: 1
- 2'b01 — 2: 0
- 2'b10 — 3: 1
- 2'b11 — 4: 1

Continued on the next page...

Register 10.1: DMABUSMODE_REG (0x0000)

Continued from the previous page ...

PROG_BURST_LEN These bits indicate the maximum number of beats to be transferred in one DMA transaction. If the number of beats to be transferred is more than 32, then perform the following steps: 1. Set the PBLx8 mode; 2. Set the PBL. (R/W)

ALT_DESC_SIZE When set, the size of the alternate descriptor increases to 32 bytes. (R/W)

DESC_SKIP_LEN This bit specifies the number of Word to skip between two unchained descriptors. The address skipping starts from the end of current descriptor to the start of next descriptor. When the DSL value is equal to zero, the descriptor table is taken as contiguous by the DMA in Ring mode. (R/W)

DMA_ARB_SCH This bit specifies the arbitration scheme between the transmit and receive paths. 1'b0: weighted round-robin with RX:TX or TX:RX, priority specified in PR (bit[15:14]); 1'b1 Fixed priority (Rx priority to Tx). (R/W)

SW_RST When this bit is set, the MAC DMA Controller resets the logic and all internal registers of the MAC. It is cleared automatically after the reset operation is complete in all of the ETH_MAC clock domains. Before reprogramming any register of the ETH_MAC, you should read a zero (0) value in this bit. (R/WS/SC)

Register 10.2: DMATXPOLLDEMAND_REG (0x0004)

31	0
0x00000000	
Reset	

DMATXPOLLDEMAND_REG When these bits are written with any value, the DMA reads the current descriptor to which the Register (Current Host Transmit Descriptor Register) is pointing. If that descriptor is not available (owned by the Host), the transmission returns to the suspend state and Bit[2] (TU) of Status Register is asserted. If the descriptor is available, the transmission resumes. (RO/WT)

Register 10.3: DMARXPOLLDEMAND_REG (0x0008)

31	0
0x00000000	
Reset	

DMARXPOLLDEMAND_REG When these bits are written with any value, the DMA reads the current descriptor to which the Current Host Receive Descriptor Register is pointing. If that descriptor is not available (owned by the Host), the reception returns to the Suspended state and Bit[7] (RU) of Status Register is asserted. If the descriptor is available, the Rx DMA returns to the active state. (RO/WT)

Register 10.4: DMARXBASEADDR_REG (0x000C)

31	0
0x00000000	
Reset	

DMARXBASEADDR_REG This field contains the base address of the first descriptor in the Receive Descriptor list. The LSB Bits[1:0] are ignored and internally taken as all-zero by the DMA. Therefore, these LSB bits are read-only. (R/W)

Register 10.5: DMATXBASEADDR_REG (0x0010)

31	0
0x00000000	
Reset	

DMATXBASEADDR_REG This field contains the base address of the first descriptor in the Transmit Descriptor list. The LSB Bits[1:0] are ignored and are internally taken as all-zero by the DMA. Therefore, these LSB bits are read-only. (R/W)

Register 10.6: DMASTATUS_REG (0x0014)

TS_TRI_INT This bit indicates an interrupt event in the Timestamp Generator block of the ETH_MAC. The software must read the corresponding registers in the ETH_MAC to get the exact cause of the interrupt and clear its source to reset this bit to 1'b0. (RO)

EMAC_PMT_INT This bit indicates an interrupt event in the PMT module of the ETH_MAC. The software must read the PMT Control and Status Register in the MAC to get the exact cause of interrupt and clear its source to reset this bit to 1'b0. (RO)

Register 10.6: DMASTATUS_REG (0x0014)

Continued from the previous page ...

ERROR_BITS This field indicates the type of error that caused a Bus Error, for example, error response on the AHB interface. This field is valid only when Bit[13] (FBI) is set. This field does not generate an interrupt. (RO)

- 3'b000: Error during Rx DMA Write Data Transfer.
- 3'b011: Error during Tx DMA Read Data Transfer.
- 3'b100: Error during Rx DMA Descriptor Write Access.
- 3'b101: Error during Tx DMA Descriptor Write Access.
- 3'b110: Error during Rx DMA Descriptor Read Access.
- 3'b111: Error during Tx DMA Descriptor Read Access.

TRANS_PROC_STATE This field indicates the Transmit DMA FSM state. This field does not generate an interrupt. (RO)

- 3'b000: Stopped. Reset or Stop Transmit Command issued.
- 3'b001: Running. Fetching Transmit Transfer Descriptor.
- 3'b010: Reserved for future use.
- 3'b011: Running. Waiting for TX packets.
- 3'b100: Suspended. Receive Descriptor Unavailable.
- 3'b101: Running. Closing Transmit Descriptor.
- 3'b110: TIME_STAMP write state.
- 3'b111: Running. Transferring the TX packets data from transmit buffer to host memory.

RECV_PROC_STATE This field indicates the Receive DMA FSM state. This field does not generate an interrupt. (RO)

- 3'b000: Stopped. Reset or Stop Receive Command issued.
- 3'b001: Running. Fetching Receive Transfer Descriptor.
- 3'b010: Reserved for future use.
- 3'b011: Running. Waiting for RX packets.
- 3'b100: Suspended. Receive Descriptor Unavailable.
- 3'b101: Running. Closing Receive Descriptor.
- 3'b110: TIME_STAMP write state.
- 3'b111: Running. Transferring the TX packets data from receive buffer to host memory.

Register 10.6: DMASTATUS_REG (0x0014)

Continued from the previous page ...

NORM_INT_SUMM Normal Interrupt Summary bit value is the logical OR of the following bits when the corresponding interrupt bits are enabled in Interrupt Enable Register: (R/SS/WC)

- Bit[0]: Transmit Interrupt.
- Bit[2]: Transmit Buffer Unavailable.
- Bit[6]: Receive Interrupt.
- Bit[14]: Early Receive Interrupt. Only unmasked bits affect the Normal Interrupt Summary bit. This is a sticky bit and must be cleared (by writing 1 to this bit) each time a corresponding bit, which causes NIS to be set, is cleared.

ABN_INT_SUMM Abnormal Interrupt Summary bit value is the logical OR of the following when the corresponding interrupt bits are enabled in Interrupt Enable Register: (R/SS/WC)

- Bit[1]: Transmit Process Stopped.
- Bit[3]: Transmit Jabber Timeout.
- Bit[4]: Receive FIFO Overflow.
- Bit[5]: Transmit Underflow.
- Bit[7]: Receive Buffer Unavailable. Bit[8]: Receive Process Stopped.
- Bit[9]: Receive Watchdog Timeout.
- Bit[10]: Early Transmit Interrupt.
- Bit[13]: Fatal Bus Error. Only unmasked bits affect the Abnormal Interrupt Summary bit. This is a sticky bit and must be cleared (by writing 1 to this bit) each time a corresponding bit, which causes AIS to be set, is cleared.

EARLY_RECV_INT This bit indicates that the DMA filled the first data buffer of the packet. This bit is cleared when the software writes 1 to this bit or when Bit[6] (RI) of this register is set (whichever occurs earlier). (R/SS/WC)

FATAL_BUS_ERR_INT This bit indicates that a bus error occurred, as described in Bits [25:23]. When this bit is set, the corresponding DMA engine disables all of its bus accesses. (R/SS/WC)

EARLY_TRANS_INT This bit indicates that the frame to be transmitted is fully transferred to the MTL Transmit FIFO. (R/SS/WC)

RECV_WDT_TO When set, this bit indicates that the Receive Watchdog Timer expired while receiving the current frame and the current frame is truncated after the watchdog timeout. (R/SS/WC)

Continued on the next page...

Register 10.6: DMASTATUS_REG (0x0014)

Continued from the previous page ...

RECV_PROC_STOP This bit is asserted when the Receive Process enters the Stopped state.
(R/SS/WC)

RECV_BUF_UNAVAIL This bit indicates that the host owns the Next Descriptor in the Receive List and the DMA cannot acquire it. The Receive Process is suspended. To resume processing Receive descriptors, the host should change the ownership of the descriptor and issue a Receive Poll Demand command. If no Receive Poll Demand is issued, the Receive Process resumes when the next recognized incoming frame is received. This bit is set only when the previous Receive Descriptor is owned by the DMA. (R/SS/WC)

RECV_INT This bit indicates that the frame reception is complete. When reception is complete, the Bit[31] of RDES1 (Disable Interrupt on Completion) is reset in the last Descriptor, and the specific frame status information is updated in the descriptor. The reception remains in the Running state.
(R/SS/WC)

TRANS_UNDFLOW This bit indicates that the Transmit Buffer had an Underflow during frame transmission. Transmission is suspended and an Underflow Error TDES0[1] is set. (R/SS/WC)

RECV_OVFLOW This bit indicates that the Receive Buffer had an Overflow during frame reception. If the partial frame is transferred to the application, the overflow status is set in RDES0[11].
(R/SS/WC)

TRANS_JABBER_TO This bit indicates that the Transmit Jabber Timer expired, which happens when the frame size exceeds 2,048 (10,240 bytes when the Jumbo frame is enabled). When the Jabber Timeout occurs, the transmission process is aborted and placed in the Stopped state. This causes the Transmit Jabber Timeout TDES0[14] flag to assert. (R/SS/WC)

TRANS_BUF_UNAVAIL This bit indicates that the host owns the Next Descriptor in the Transmit List and the DMA cannot acquire it. Transmission is suspended. Bits[22:20] explain the Transmit Process state transitions. To resume processing Transmit descriptors, the host should change the ownership of the descriptor by setting TDES0[31] and then issue a Transmit Poll Demand command. (R/SS/WC)

TRANS_PROC_STOP This bit is set when the transmission is stopped. (R/SS/WC)

TRANS_INT This bit indicates that the frame transmission is complete. When transmission is complete, Bit[31] (OWN) of TDES0 is reset, and the specific frame status information is updated in the descriptor. (R/SS/WC)

Register 10.7: DMAIN_EN_REG (0x001C)

(reserved)																DMAIN_NISE	DMAIN_AISE	DMAIN_ERIE	DMAIN_FBEE	(reserved)				DMAIN_ETIE	DMAIN_RWTE	DMAIN_RSE	DMAIN_RBUJ	DMAIN_RIE	DMAIN_LIE	DMAIN_OIE	DMAIN_TJTE	DMAIN_TBUJ	DMAIN_TSE	DMAIN_TIE

DMAIN_NISE When this bit is set, normal interrupt summary is enabled. When this bit is reset, normal interrupt summary is disabled. This bit enables the following interrupts in Status Register: (R/W)

- Bit[0]: Transmit Interrupt.
- Bit[2]: Transmit Buffer Unavailable.
- Bit[6]: Receive Interrupt.
- Bit[14]: Early Receive Interrupt.

DMAIN_AISE When this bit is set, abnormal interrupt summary is enabled. When this bit is reset, the abnormal interrupt summary is disabled. This bit enables the following interrupts in Status Register:(R/W)

- Bit[1]: Transmit Process Stopped.
- Bit[3]: Transmit Jabber Timeout.
- Bit[4]: Receive Overflow.
- Bit[5]: Transmit Underflow.
- Bit[7]: Receive Buffer Unavailable.
- Bit[8]: Receive Process Stopped.
- Bit[9]: Receive Watchdog Timeout.
- Bit[10]: Early Transmit Interrupt.
- Bit[13]: Fatal Bus Error.

DMAIN_ERIE When this bit is set with Normal Interrupt Summary Enable (Bit[16]), the Early Receive Interrupt is enabled. When this bit is reset, the Early Receive Interrupt is disabled. (R/W)

Continued on the next page...

Register 10.7: DMABUSMODE_REG (0x0000)

Continued from the previous page ...

DMAIN_FBEE When this bit is set with Abnormal Interrupt Summary Enable (Bit[15]), the Fatal Bus Error Interrupt is enabled. When this bit is reset, the Fatal Bus Error Enable Interrupt is disabled. (R/W)

DMAIN_ETIE When this bit is set with an Abnormal Interrupt Summary Enable (Bit[15]), the Early Transmit Interrupt is enabled. When this bit is reset, the Early Transmit Interrupt is disabled. (R/W)

DMAIN_RWTE When this bit is set with Abnormal Interrupt Summary Enable (Bit[15]), the Receive Watchdog Timeout Interrupt is enabled. When this bit is reset, the Receive Watchdog Timeout Interrupt is disabled. (R/W)

DMAIN_RSE When this bit is set with Abnormal Interrupt Summary Enable (Bit[15]), the Receive Stopped Interrupt is enabled. When this bit is reset, the Receive Stopped Interrupt is disabled. (R/W)

DMAIN_RBUE When this bit is set with Abnormal Interrupt Summary Enable (Bit[15]), the Receive Buffer Unavailable Interrupt is enabled. When this bit is reset, the Receive Buffer Unavailable Interrupt is disabled. (R/W)

DMAIN_RIE When this bit is set with Normal Interrupt Summary Enable (Bit[16]), the Receive Interrupt is enabled. When this bit is reset, the Receive Interrupt is disabled. (R/W)

DMAIN_UIE When this bit is set with Abnormal Interrupt Summary Enable (Bit[15]), the Transmit Underflow Interrupt is enabled. When this bit is reset, the Underflow Interrupt is disabled. (R/W)

DMAIN_OIE When this bit is set with Abnormal Interrupt Summary Enable (Bit[15]), the Receive Overflow Interrupt is enabled. When this bit is reset, the Overflow Interrupt is disabled. (R/W)

DMAIN_TJTE When this bit is set with Abnormal Interrupt Summary Enable (Bit[15]), the Transmit Jabber Timeout Interrupt is enabled. When this bit is reset, the Transmit Jabber Timeout Interrupt is disabled. (R/W)

DMAIN_TBUE When this bit is set with Normal Interrupt Summary Enable (Bit 16), the Transmit Buffer Unavailable Interrupt is enabled. When this bit is reset, the Transmit Buffer Unavailable Interrupt is disabled. (R/W)

DMAIN_TSE When this bit is set with Abnormal Interrupt Summary Enable (Bit[15]), the Transmission Stopped Interrupt is enabled. When this bit is reset, the Transmission Stopped Interrupt is disabled. (R/W)

DMAIN_TIE When this bit is set with Normal Interrupt Summary Enable (Bit[16]), the Transmit Interrupt is enabled. When this bit is reset, the Transmit Interrupt is disabled. (R/W)

RIWTC This bit indicates the number of system clock cycles multiplied by 256 for which the watchdog timer is set. The watchdog timer gets triggered with the programmed value after the Rx DMA completes the transfer of a frame for which the RI status bit is not set because of the setting in the corresponding descriptor RDES1[31]. When the watchdog timer runs out, the RI bit is set and the timer is stopped. The watchdog timer is reset when the RI bit is set high because of automatic setting of RI as per RDES1[31] of any received frame. (R/W)

SAIRC This field controls the source address insertion or replacement for all transmitted frames. Bit[30] specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits [29:28]: (R/W)

- 2'b0x: The input signals mti_sa_ctrl_i and ati_sa_ctrl_i control the SA field generation.
- 2'b10: If Bit[30] is set to 0, the MAC inserts the content of the MAC Address 0 registers in the SA field of all transmitted frames. If Bit[30] is set to 1 the MAC inserts the content of the MAC Address 1 registers in the SA field of all transmitted frames.
- 2'b11: If Bit[30] is set to 0, the MAC replaces the content of the MAC Address 0 registers in the SA field of all transmitted frames. If Bit[30] is set to 1, the MAC replaces the content of the MAC Address 1 registers in the SA field of all transmitted frames.

ASS2KP When set, the MAC considers all frames, with up to 2,000 bytes length, as normal packets. When Bit[20] (JE) is not set, the MAC considers all received frames of size more than 2K bytes as Giant frames. When this bit is reset and Bit[20] (JE) is not set, the MAC considers all received frames of size more than 1,518 bytes (1,522 bytes for tagged) as Giant frames. When Bit[20] is set, setting this bit has no effect on Giant Frame status. (R/W)

EMACWATCHDOG When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive frames of up to 16,383 bytes. When this bit is reset, the MAC does not allow a receive frame which more than 2,048 bytes (10,240 if JE is set high) or the value programmed in Register (Watchdog Timeout Register). The MAC cuts off any bytes received after the watchdog limit number of bytes. (R/W)

EMACJABBER When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer frames of up to 16,383 bytes. When this bit is reset, the MAC cuts off the transmitter if the application sends out more than 2,048 bytes of data (10,240 if JE is set high) during transmission. (R/W)

EMACJUMBOFRAME When this bit is set, the MAC allows Jumbo frames of 9,018 bytes (9,022 bytes for VLAN tagged frames) without reporting a giant frame error in the receive frame status.
(R/W)

Continued on the next page...

Register 10.13: EMACCONFIG_REG (0x1000)

Continued from the previous page ...

EMACINTERFRAMEGAP These bits control the minimum IFG between frames during transmission.
(R/W)

- 3'b000: 96 bit times.
- 3'b001: 88 bit times.
- 3'b010: 80 bit times.
- 3'b111: 40 bit times. In the half-duplex mode, the minimum IFG can be configured only for 64 bit times (IFG = 100). Lower values are not considered.

EMACDISABLECRS When set high, this bit makes the MAC transmitter ignore the MII CRS signal during frame transmission in the half-duplex mode. This request results in no errors generated because of Loss of Carrier or No Carrier during such transmission. When this bit is low, the MAC transmitter generates such errors because of Carrier Sense and can even abort the transmissions.
(R/W)

EMACMII This bit selects the Ethernet line speed. It should be set to 1 for 10 or 100 Mbps operations. In 10 or 100 Mbps operations, this bit, along with FES bit, it selects the exact linespeed. In the 10/100 Mbps-only operations, the bit is always 1. (R/W)

EMACFESPEED This bit selects the speed in the MII, RMII interface. 0: 10 Mbps; 1: 100 Mbps.
(R/W)

EMACRXOWN When this bit is set, the MAC disables the reception of frames when the TX_EN is asserted in the half-duplex mode. When this bit is reset, the MAC receives all packets that are given by the PHY while transmitting. This bit is not applicable if the MAC is operating in the full-duplex mode. (R/W)

EMACLOOPBACK When this bit is set, the MAC operates in the loopback mode MII. The MII Receive clock input (CLK_RX) is required for the loopback to work properly, because the transmit clock is not looped-back internally. (R/W)

EMACDUPLEX When this bit is set, the MAC operates in the full-duplex mode where it can transmit and receive simultaneously. This bit is read only with default value of 1'b1 in the full-duplex-mode.
(R/W)

EMACRXIPCOFFLOAD When this bit is set, the MAC calculates the 16-bit one's complement of the one's complement sum of all received Ethernet frame payloads. It also checks whether the IPv4 Header checksum (assumed to be bytes 25/26 or 29/30 (VLAN-tagged) of the received Ethernet frame) is correct for the received frame and gives the status in the receive status word. The MAC also appends the 16-bit checksum calculated for the IP header datagram payload (bytes after the IPv4 header) and appends it to the Ethernet frame transferred to the application (when Type 2 COE is deselected). When this bit is reset, this function is disabled. (R/W)

Continued on the next page...

Register 10.13: EMACCONFIG_REG (0x1000)

Continued from the previous page ...

EMACRETRY When this bit is set, the MAC attempts only one transmission. When a collision occurs on the MII interface, the MAC ignores the current frame transmission and reports a Frame Abort with excessive collision error in the transmit frame status. When this bit is reset, the MAC attempts retries based on the settings of the BL field (Bits [6:5]). This bit is applicable only in the half-duplex mode. (R/W)

EMACPADCRCSTRIP When this bit is set, the MAC strips the Pad or FCS field on the incoming frames only if the value of the length field is less than 1,536 bytes. All received frames with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field. When this bit is reset, the MAC passes all incoming frames, without modifying them, to the Host. (R/W)

EMACBACKOFFLIMIT The Back-Off limit determines the random integer number (r) of slot time delays (512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision. This bit is applicable only in the half-duplex mode.

- 00: $k = \min(n, 10)$.
- 01: $k = \min(n, 8)$.
- 10: $k = \min(n, 4)$.
- 11: $k = \min(n, 1)$, n = retransmission attempt. The random integer r takes the value in the range $0 \sim 2000$.

EMACDEFERRALCHECK Deferral Check. (R/W)

EMACTX When this bit is set, the transmit state machine of the MAC is enabled for transmission on the MII. When this bit is reset, the MAC transmit state machine is disabled after the completion of the transmission of the current frame, and does not transmit any further frames. (R/W)

EMACRX When this bit is set, the receiver state machine of the MAC is enabled for receiving frames from the MII. When this bit is reset, the MAC receive state machine is disabled after the completion of the reception of the current frame, and does not receive any further frames from the MII. (R/W)

PLTF These bits control the number of preamble bytes that are added to the beginning of every Transmit frame. The preamble reduction occurs only when the MAC is operating in the full-duplex mode. 2'b00: 7 bytes of preamble. 2'b01: 5 bytes of preamble. 2'b10: 3 bytes of preamble. (R/W)

Register 10.14: EMACFF_REG (0x1004)

RECEIVE_ALL		(reserved)										SAFE		SAIF	PCF	DBF	PAM	DAIF	(reserved)		PMODE	
31	30											10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

Reset

RECEIVE_ALL When this bit is set, the MAC Receiver module passes all received frames, irrespective of whether they pass the address filter or not, to the Application. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bits in the Receive Status Word. When this bit is reset, the Receiver module passes only those frames to the Application that pass the SA or DA address filter. (R/W)

SAFE When this bit is set, the MAC compares the SA field of the received frames with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the frame. When this bit is reset, the MAC forwards the received frame to the application with updated SAF bit of the Rx Status depending on the SA address comparison. (R/W)

SAIF When this bit is set, the Address Check block operates in inverse filtering mode for the SA address comparison. The frames whose SA matches the SA registers are marked as failing the SA Address filter. When this bit is reset, frames whose SA does not match the SA registers are marked as failing the SA Address filter. (R/W)

PCF These bits control the forwarding of all control frames (including unicast and multicast Pause frames). (R/W)

- 2'b00: MAC filters all control frames from reaching the application.
- 2'b01: MAC forwards all control frames except Pause frames to application even if they fail the Address filter.
- 2'b10: MAC forwards all control frames to application even if they fail the Address Filter.
- 2'b11: MAC forwards control frames that pass the Address Filter.

The following conditions should be true for the Pause frames processing:

- Condition 1: The MAC is in the full-duplex mode and flow control is enabled by setting Bit 2 (RFE) of Register (Flow Control Register) to 1.
- Condition 2: The destination address (DA) of the received frame matches the special multicast address or the MAC Address 0 when Bit 3 (UP) of the Register(Flow Control Register) is set.
- Condition 3: The Type field of the received frame is 0x8808 and the OPCODE field is 0x0001.

DBF When this bit is set, the AFM module blocks all incoming broadcast frames. In addition, it overrides all other filter settings. When this bit is reset, the AFM module passes all received broadcast frames. (R/W)

PAM When set, this bit indicates that all received frames with a multicast destination address (first bit in the destination address field is '1') are passed. When reset, filtering of multicast frame depends on HMC bit. (R/W)

Continued on the next page...

Register 10.14: EMACFF_REG (0x1004)

Continued from the previous page ...

DAIF When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast frames. When reset, normal filtering of frames is performed. (R/W)

PMODE When this bit is set, the Address Filter module passes all incoming frames irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Receive Status Word are always cleared when PR is set. (R/W)

Register 10.15: EMACMIIADDR_REG (0x1010)

(reserved)																MIDEV				MIIREG				MICSROLK				MIWRITE		MIIBUSY					
31															16	15					11	10					6	5					2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0x00				0x00				0x00				0	0	Reset					

MIIDEV This field indicates which of the 32 possible PHY devices are being accessed. (R/W)

MIIREG These bits select the desired MII register in the selected PHY device. (R/W)

MIICSRCLK CSR clock range: 1.0 MHz ~ 2.5 MHz. (R/W)

- 4'b0000: When the APB clock frequency is 80 MHz, the MDC clock frequency is APB CLK/42;
- 4'b0000: When the APB clock frequency is 40 MHz, the MDC clock frequency is APB CLK/26.

MIIWRITE When set, this bit indicates to the PHY that this is a Write operation using the MII Data register. If this bit is not set, it indicates that this is a Read operation, that is, placing the data in the MII Data register. (R/W)

MIIBUSY This bit should read logic 0 before writing to PHY Addr Register and PHY data Register. During a PHY register access, the software sets this bit to 1'b1 to indicate that a Read or Write access is in progress. PHY data Register is invalid until this bit is cleared by the MAC. Therefore, PHY data Register (MII Data) should be kept valid until the MAC clears this bit during a PHY Write operation. Similarly for a read operation, the contents of Register 5 are not valid until this bit is cleared. The subsequent read or write operation should happen only after the previous operation is complete. Because there is no acknowledgment from the PHY to MAC after a read or write operation is completed, there is no change in the functionality of this bit even when the PHY is not present. (R/WS/SC)

Register 10.16: EMACMIIDATA_REG (0x1014)

(reserved)																MII_DATA																															
31																15																0															
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0																0x00000																Reset															

MII_DATA This field contains the 16-bit data value read from the PHY after a Management Read operation or the 16-bit data value to be written to the PHY before a Management Write operation.
(R/W)

Register 10.17: EMACFC_REG (0x1018)

PAUSE_TIME																(reserved)																PLT		UPFD		RFCE		TFCE		FCBBA																																																																																																																																																																																							
31																16																15																6																5	4	3	2	1	0																																																																																																																																																										
0x00000																0																0																0																0																0																0																0																0x0																0																0																0																0																Reset															

PAUSE_TIME This field holds the value to be used in the Pause Time field in the transmit control frame. If the Pause Time bits is configured to be double-synchronized to the MII clock domain, then consecutive writes to this register should be performed only after at least four clock cycles in the destination clock domain. (R/W)

PLT This field configures the threshold of the Pause timer automatic retransmission of the Pause frame. The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot-times), and PLT = 01, then a second Pause frame is automatically transmitted at 228 (256-28) slot times after the first Pause frame is transmitted. The following list provides the threshold values for different values: (R/W)

- 2'b00: The threshold is Pause time minus 4 slot times (PT-4 slot times).
- 2'b01: The threshold is Pause time minus 28 slot times (PT-28 slot times).
- 2'b10: The threshold is Pause time minus 144 slot times (PT-144 slot times).
- 2'b11: The threshold is Pause time minus 256 slot times (PT-256 slot times). The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the MII interface.

UPFD A pause frame is processed when it has the unique multicast address specified in the IEEE Std 802.3. When this bit is set, the MAC can also detect Pause frames with unicast address of the station. This unicast address should be as specified in the EMACADDR0 High Register and EMACADDR0 Low Register. When this bit is reset, the MAC only detects Pause frames with unique multicast address. (R/W)

RFCE When this bit is set, the MAC decodes the received Pause frame and disables its transmitter for a specified (Pause) time. When this bit is reset, the decode function of the Pause frame is disabled. (R/W)

TFCE In the full-duplex mode, when this bit is set, the MAC enables the flow control operation to transmit Pause frames. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause frames. In the half-duplex mode, when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled. (R/W)

FCBBA This bit initiates a Pause frame in the full-duplex mode and activates the backpressure function in the half-duplex mode if the TFE bit is set. In the full-duplex mode, this bit should be read as 1'b0 before writing to the Flow Control register. To initiate a Pause frame, the Application must set this bit to 1'b1. During a transfer of the Control Frame, this bit continues to be set to signify that a frame transmission is in progress. After the completion of Pause frame transmission, the MAC resets this bit to 1'b0. The Flow Control register should not be written to until this bit is cleared. In the half-duplex mode, when this bit is set (and TFE is set), then backpressure is asserted by the MAC. During backpressure, when the MAC receives a new frame, the transmitter starts sending a JAM pattern resulting in a collision. When the MAC is configured for the full-duplex mode, the BPA is automatically disabled. (R/WS/SC)(FCB)/(R/W)(BPA)

Register 10.18: EMACDEBUG_REG (0x1024)

(reserved)						MTLTSFFS	MTLTFNES	(reserved)		MTLTFWCS	MTLTFRCS	MACTP	MACTFCS	MACTPES	(reserved)						MTLRFFLS	(reserved)		MTLRFRCs	MTLRFWCAS	(reserved)		MACRFCS	MACRPES					
31						26	25	24	23	22	21	20	19	18	17	16	15							10	9	8	7	6	5	4	3	2	1	0

MTLTSFFS When high, this bit indicates that the MTL TxStatus FIFO is full. Therefore, the MTL cannot accept any more frames for transmission. (RO)

MTLTFNES When high, this bit indicates that the MTL Tx FIFO is not empty and some data is left for transmission. (RO)

MTLTFWCS When high, this bit indicates that the MTL Tx FIFO Write Controller is active and is transferring data to the Tx FIFO. (RO)

MTLTFRCS This field indicates the state of the Tx FIFO Read Controller: (RO)

- 2'b00: IDLE state.
- 2'b01: READ state (transferring data to the MAC transmitter).
- 2'b10: Waiting for TxStatus from the MAC transmitter.
- 2'b11: Writing the received TxStatus or flushing the Tx FIFO.

MACTP When high, this bit indicates that the MAC transmitter is in the Pause condition (in the full-duplex-mode) and hence does not schedule any frame for transmission. (RO)

MACTFCS This field indicates the state of the MAC Transmit Frame Controller module: (RO)

- 2'b00: IDLE state.
- 2'b01: Waiting for status of previous frame or IFG or backoff period to be over.
- 2'b10: Generating and transmitting a Pause frame (in the full-duplex mode).
- 2'b11: Transferring input frame for transmission.

MACTPES When high, this bit indicates that the MAC MII transmit protocol engine is actively transmitting data and is not in the IDLE state. (RO)

MTLRFFLS This field gives the status of the fill-level of the Rx FIFO: (RO)

- 2'b00: Rx FIFO Empty.
- 2'b01: Rx FIFO fill-level below flow-control deactivate threshold.
- 2'b10: Rx FIFO fill-level above flow-control activate threshold.
- 2'b11: Rx FIFO Full.

Continued on the next page...

Register 10.18: EMACDEBUG_REG (0x1024)

Continued from the previous page ...

MTLRFRCSS This field gives the state of the Rx FIFO read Controller: (RO)

2'b00: IDLE state.

2'b01: Reading frame data.

2'b10: Reading frame status (or timestamp).

2'b11: Flushing the frame data and status.

MTLRFWCAS When high, this bit indicates that the MTL Rx FIFO Write Controller is active and is transferring a received frame to the FIFO. (RO)**MACRFFCS** When high, this field indicates the active state of the FIFO Read and Write controllers of the MAC Receive Frame Controller Module. RFCFCSTS[1] represents the status of FIFO Read controller. RFCFCSTS[0] represents the status of small FIFO Write controller. (RO)**MACRPES** When high, this bit indicates that the MAC MII receive protocol engine is actively receiving data and not in IDLE state. (RO)**Register 10.19: EMACINTS_REG (0x1038)**

(reserved)																LPIINTS		(reserved)				PMTINTS		(reserved)		
31											11	10	9	8					4	3	2	0				
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset

LPIINTS When the Energy Efficient Ethernet feature is enabled, this bit is set for any LPI state entry or exit in the MAC Transmitter or Receiver. This bit is cleared on reading Bit[0] of Register (LPI Control and Status Register). (RO)**TINTS** this bit is set when any of the following conditions is true: The system time value equals or exceeds the value specified in the Target Time High and Low registers. There is an overflow in the seconds register. The Auxiliary snapshot trigger is asserted. This bit is cleared on reading Bit[0] of Register (Timestamp Status Register). If default Timestamping is enabled, when set, this bit indicates that the system time value is equal to or exceeds the value specified in the Target Time registers. In this mode, this bit is cleared after the completion of the read of this bit. (RO/R/SS/RC)**PMTINTS** This bit is set when a magic packet or remote wake-up frame is received in the power-down mode (see Bit[5] and Bit[6] in the PMT Control and Status Register). This bit is cleared when both Bits[6:5] are cleared because of a read operation to the PMT Control and Status register. This bit is valid only when you select the optional PMT module during core configuration. (RO)

261

EMACADDR0LOW_REG This field contains the lower 32 bits of the first 6-byte MAC address. This is used by the MAC for filtering the received frames and inserting the MAC address in the Transmit Flow Control (Pause) Frames. (R/W)

Register 10.23: EMACADDR1HIGH_REG (0x1048)

ADDRESS_ENABLE1 SOURCE_ADDRESS		MASK_BYTE_CONTROL		(reserved)								MAC_ADDRESS1_HI							
31	30	29	24	23							16	15							0
0	0		0x00	0	0	0	0	0	0	0								0x0FFF	Reset

ADDRESS_ENABLE1 When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. (R/W)

SOURCE_ADDRESS When this bit is set, the EMACADDR1[47:0] is used to compare with the SA fields of the received frame. When this bit is reset, the EMACADDR1[47:0] is used to compare with the DA fields of the received frame. (R/W)

MASK_BYTE_CONTROL These bits are mask control bits for comparison of each of the EMACADDR1 bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of EMACADDR1 registers. Each bit controls the masking of the bytes as follows:

- Bit[29]: EMACADDR1 High [15:8].
- Bit[28]: EMACADDR1 High [7:0].
- Bit[27]: EMACADDR1 Low [31:24].
- Bit[24]: EMACADDR1 Low [7:0].

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

MAC_ADDRESS1_HI This field contains the upper 16 bits, Bits[47:32] of the second 6-byte MAC address. (R/W)

Register 10.24: EMACADDR1LOW_REG (0x104C)

31	0
0x0FFFFFFF	
Reset	

EMACADDR1LOW_REG This field contains the lower 32 bits of the second 6-byte MAC address. The content of this field is undefined, so the register needs to be configured after the initialization process. (R/W)

Register 10.25: EMACADDR2HIGH_REG (0x1050)

31	30	29	24	23							16	15							0
0	0		0x00	0	0	0	0	0	0	0								0x0FFF	Reset

ADDRESS_ENABLE2 When this bit is set, the address filter module uses the third MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. (R/W)

SOURCE_ADDRESS2 When this bit is set, the EMACADDR2[47:0] is used to compare with the SA fields of the received frame. When this bit is reset, the EMACADDR2[47:0] is used to compare with the DA fields of the received frame. (R/W)

MASK_BYTE_CONTROL2 These bits are mask control bits for comparison of each of the EMACADDR2 bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of EMACADDR2 registers. Each bit controls the masking of the bytes as follows:

- Bit[29]: EMACADDR2 High [15:8].
- Bit[28]: EMACADDR2 High [7:0].
- Bit[27]: EMACADDR2 Low [31:24].
- Bit[24]: EMACADDR2 Low [7:0].

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

MAC_ADDRESS2_HI This field contains the upper 16 bits, Bits[47:32] of the third 6-byte MAC address. (R/W)

Register 10.26: EMACADDR2LOW_REG (0x1054)

31	0
0xFFFFFFFF	
Reset	

EMACADDR2LOW_REG This field contains the lower 32 bits of the third 6-byte MAC address. The content of this field is undefined, so the register needs to be configured after the initialization process. (R/W)

Register 10.27: EMACADDR3HIGH_REG (0x1058)

ADDRESS_ENABLE3 SOURCE_ADDRESS3		MASK_BYTE_CONTROL3		(reserved)								MAC_ADDRESS3_HI							
31	30	29	24	23							16	15							0
0	0		0x00	0	0	0	0	0	0	0								0x0FFF	Reset

ADDRESS_ENABLE3 When this bit is set, the address filter module uses the fourth MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. (R/W)

SOURCE_ADDRESS3 When this bit is set, the EMACADDR3[47:0] is used to compare with the SA fields of the received frame. When this bit is reset, the EMACADDR3[47:0] is used to compare with the DA fields of the received frame. (R/W)

MASK_BYTE_CONTROL3 These bits are mask control bits for comparison of each of the EMACADDR3 bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of EMACADDR3 registers. Each bit controls the masking of the bytes as follows:

- Bit[29]: EMACADDR3 High [15:8].
- Bit[28]: EMACADDR3 High [7:0].
- Bit[27]: EMACADDR3 Low [31:24].
- Bit[24]: EMACADDR3 Low [7:0].

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

MAC_ADDRESS3_HI This field contains the upper 16 bits, Bits[47:32] of the fourth 6-byte MAC address. (R/W)

Register 10.28: EMACADDR3LOW_REG (0x105C)

31	0
0x0FFFFFFF	
Reset	

EMACADDR3LOW_REG This field contains the lower 32 bits of the fourth 6-byte MAC address. The content of this field is undefined, so the register needs to be configured after the initialization process. (R/W)

Register 10.29: EMACADDR4HIGH_REG (0x1060)

ADDRESS_ENABLE4 SOURCE_ADDRESS4		MASK_BYTE_CONTROL4		(reserved)								MAC_ADDRESS4_HI							
31	30	29	24	23							16	15							0
0	0		0x00	0	0	0	0	0	0	0								0x0FFF	Reset

ADDRESS_ENABLE4 When this bit is set, the address filter module uses the fifth MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. (R/W)

SOURCE_ADDRESS4 When this bit is set, the EMACADDR4[47:0] is used to compare with the SA fields of the received frame. When this bit is reset, the EMACADDR4[47:0] is used to compare with the DA fields of the received frame. (R/W)

MASK_BYTE_CONTROL4 These bits are mask control bits for comparison of each of the EMACADDR4 bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of EMACADDR4 registers. Each bit controls the masking of the bytes as follows:

- Bit[29]: EMACADDR4 High [15:8].
- Bit[28]: EMACADDR4 High [7:0].
- Bit[27]: EMACADDR4 Low [31:24].
- Bit[24]: EMACADDR4 Low [7:0].

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

MAC_ADDRESS4_HI This field contains the upper 16 bits, Bits[47:32] of the fifth 6-byte MAC address. (R/W)

Register 10.30: EMACADDR4LOW_REG (0x1064)

31	0
0x0FFFFFFF	

Reset

EMACADDR4LOW_REG This field contains the lower 32 bits of the fifth 6-byte MAC address. The content of this field is undefined, so the register needs to be configured after the initialization process. (R/W)

Register 10.31: EMACADDR5HIGH_REG (0x1068)

ADDRESS_ENABLE5 SOURCE_ADDRESS5		MASK_BYTE_CONTROL5		(reserved)								MAC_ADDRESS5_HI							
31	30	29	24	23							16	15							0
0	0		0x00	0	0	0	0	0	0	0								0x0FFF	Reset

ADDRESS_ENABLE5 When this bit is set, the address filter module uses the sixth MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. (R/W)

SOURCE_ADDRESS5 When this bit is set, the EMACADDR5[47:0] is used to compare with the SA fields of the received frame. When this bit is reset, the EMACADDR5[47:0] is used to compare with the DA fields of the received frame. (R/W)

MASK_BYTE_CONTROL5 These bits are mask control bits for comparison of each of the EMACADDR5 bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of EMACADDR5 registers. Each bit controls the masking of the bytes as follows:

- Bit[29]: EMACADDR5 High [15:8].
- Bit[28]: EMACADDR5 High [7:0].
- Bit[27]: EMACADDR5 Low [31:24].
- Bit[24]: EMACADDR5 Low [7:0].

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

MAC_ADDRESS5_HI This field contains the upper 16 bits, Bits[47:32] of the sixth 6-byte MAC address. (R/W)

Register 10.32: EMACADDR5LOW_REG (0x106C)

31	0
0xFFFFFFFF	
Reset	

EMACADDR5LOW_REG This field contains the lower 32 bits of the sixth 6-byte MAC address. The content of this field is undefined, so the register needs to be configured after the initialization process. (R/W)

Register 10.33: EMACADDR6HIGH_REG (0x1070)

ADDRESS_ENABLE6 SOURCE_ADDRESS6		MASK_BYTE_CONTROL6		(reserved)								MAC_ADDRESS6_HI							
31	30	29	24	23							16	15							0
0	0		0x00	0	0	0	0	0	0	0								0x0FFF	Reset

ADDRESS_ENABLE6 When this bit is set, the address filter module uses the seventh MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. (R/W)

SOURCE_ADDRESS6 When this bit is set, the EMACADDR6[47:0] is used to compare with the SA fields of the received frame. When this bit is reset, the EMACADDR6[47:0] is used to compare with the DA fields of the received frame. (R/W)

MASK_BYTE_CONTROL6 These bits are mask control bits for comparison of each of the EMACADDR6 bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of EMACADDR6 registers. Each bit controls the masking of the bytes as follows:

- Bit[29]: EMACADDR6 High [15:8].
- Bit[28]: EMACADDR6 High [7:0].
- Bit[27]: EMACADDR6 Low [31:24].
- Bit[24]: EMACADDR6 Low [7:0].

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

MAC_ADDRESS6_HI This field contains the upper 16 bits, Bits[47:32] of the seventh 6-byte MAC address. (R/W)

Register 10.34: EMACADDR6LOW_REG (0x1074)

31	0
0x0FFFFFFF	
Reset	

EMACADDR6LOW_REG This field contains the lower 32 bits of the seventh 6-byte MAC address. The content of this field is undefined, so the register needs to be configured after the initialization process. (R/W)

Register 10.35: EMACADDR7HIGH_REG (0x1078)

ADDRESS_ENABLE7 SOURCE_ADDRESS7		MASK_BYTE_CONTROL7		(reserved)								MAC_ADDRESS7_HI							
31	30	29	24	23							16	15							0
0	0		0x00	0	0	0	0	0	0	0								0x0FFF	Reset

ADDRESS_ENABLE7 When this bit is set, the address filter module uses the eighth MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering. (R/W)

SOURCE_ADDRESS7 When this bit is set, the EMACADDR7[47:0] is used to compare with the SA fields of the received frame. When this bit is reset, the EMACADDR7[47:0] is used to compare with the DA fields of the received frame. (R/W)

MASK_BYTE_CONTROL7 These bits are mask control bits for comparison of each of the EMACADDR7 bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of EMACADDR7 registers. Each bit controls the masking of the bytes as follows:

- Bit[29]: EMACADDR7 High [15:8].
- Bit[28]: EMACADDR7 High [7:0].
- Bit[27]: EMACADDR7 Low [31:24].
- Bit[24]: EMACADDR7 Low [7:0].

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address. (R/W)

MAC_ADDRESS7_HI This field contains the upper 16 bits, Bits[47:32] of the eighth 6-byte MAC address. (R/W)

Register 10.36: EMACADDR7LOW_REG (0x107C)

31	0
0x0FFFFFFF	
Reset	

EMACADDR7LOW_REG This field contains the lower 32 bits of the eighth 6-byte MAC address. The content of this field is undefined, so the register needs to be configured after the initialization process. (R/W)

269

EMAC_RAN When set, this bit causes auto-negotiation to restart if Bit[12](ANE) is set. This bit is self-clearing after auto-negotiation starts. This bit should be cleared for normal operation. (R/W/SC)

EMAC_LS This bit decides whether the data link is established. Setting this bit to 1 means not establishing the link. (R/WS/SC)

Register 10.39: EMACSTATUS_REG (0x10D8)

(reserved)																SMDRXS		(reserved)																(JABBER_TIMEOUT)		(reserved)		LINK_SPEED		LINK_MODE	
31																17	16	15																5	4	3	2	1	0		
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Reset						

JABBER_TIMEOUT This bit indicates whether there is jabber timeout error (1'b1) in the received frame. (RO)

LINK_SPEED This bit indicates the current speed of the link: (RO)

- 2'b00: 2.5 MHz.
- 2'b01: 25 MHz.
- 2'b10: 125 MHz.

LINK_MODE This bit indicates the current mode of operation of the link: (RO)

- 1'b0: Half-duplex mode.
- 1'b1: Full-duplex mode.

Register 10.40: EMACWDOGTO_REG (0x10DC)

(reserved)																PWDOGEN		(reserved)		WDOGTO																
31																17	16	15	14	13																0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0x0000																Reset	

PWDOGEN When this bit is set and Bit[23] (WD) of EMACCONFIG_REG is reset, the WTO field (Bits[13:0]) is used as watchdog timeout for a received frame. When this bit is cleared, the watchdog timeout for a received frame is controlled by the setting of Bit[23] (WD) and Bit[20] (JE) in EMACCONFIG_REG. (R/W)

WDOGTO When Bit[16] (PWE) is set and Bit[23] (WD) of EMACCONFIG_REG is reset, this field is used as watchdog timeout for a received frame. If the length of a received frame exceeds the value of this field, such frame is terminated and declared as an error frame. (R/W)

Register 10.41: EMAC_EX_CLKOUT_CONF_REG (0x0000)

(reserved)																								EMAC_CLK_OUT_H_DIV_NUM				EMAC_CLK_OUT_DIV_NUM						
31																								8	7	4				3	0			
0 0																								0x02				0x04				Reset		

EMAC_CLK_OUT_H_DIV_NUM RMII CLK using internal PLLA CLK, the half divider number, when using RMII PHY. (R/W)

EMAC_CLK_OUT_DIV_NUM RMII CLK using internal PLLA CLK, the whole divider number, when using RMII PHY. (R/W)

Register 10.42: EMAC_EX_OSCCLK_CONF_REG (0x0004)

11. I2C Controller

11.1 Overview

An I2C (Inter-Integrated Circuit) bus can be used for communication with several external devices connected to the same bus as ESP32. The ESP32 has dedicated hardware to communicate with peripherals on the I2C bus.

11.2 Features

The I2C controller has the following features:

- Supports both master mode and slave mode
- Supports multi-master and multi-slave communication
- Supports standard mode (100 kbit/s)
- Supports fast mode (400 kbit/s)
- Supports 7-bit addressing and 10-bit addressing
- Supports continuous data transmission with disabled Serial Clock Line (SCL)
- Supports programmable digital noise filter

11.3 Functional Description

11.3.1 Introduction

I2C is a two-wire bus, consisting of an SDA and an SCL line. These lines are configured to open the drain output. The lines are shared by two or more devices: usually one or more masters and one or more slaves.

Communication starts when a master sends out a start condition: it will pull the SDA line low, and will then pull the SCL line high. It will send out nine clock pulses over the SCL line. The first eight pulses are used to shift out a byte consisting of a 7-bit address and a read/write bit. If a slave with this address is active on the bus, the slave can answer by pulling the SDA low on the ninth clock pulse. The master can then send out more 9-bit clock pulse clusters and, depending on the read/write bit sent, the device or the master will shift out data on the SDA line, with the other side acknowledging the transfer by pulling the SDA low on the ninth clock pulse. During data transfer, the SDA line changes only when the SCL line is low. When the master has finished the communication, it will send a stop condition on the bus by raising SDA, while SCL will already be high.

The ESP32 I2C peripheral can handle the I2C protocol, freeing up the processor cores for other tasks.

11.3.2 Architecture

Figure 47: I2C Master Architecture

Figure 48: I2C Slave Architecture

An I2C controller can operate either in master mode or slave mode. The I2C_MS_MODE register is used to select the mode. Figure 47 shows the I2C Master architecture, while Figure 48 shows the I2C Slave architecture. The I2C controller contains the following units:

- RAM, the size of which is 32 x 8 bits, and it is directly mapped onto the address space of the CPU cores, starting at address REG_I2C_BASE+0x100. Each byte of I2C data is stored in a 32-bit word of memory (so, the first byte is at +0x100, the second byte at +0x104, the third byte at +0x108, etc.) Users need to set register I2C_NONFIFO_EN.
- A CMD_Controller and 16 command registers (cmd0 ~ cmd15), which are used by the I2C Master to control data transmission. One command at a time is executed by the I2C controller.
- SCL_FSM: A state machine that controls the SCL clock. The I2C_SCL_HIGH_PERIOD_REG and I2C_SCL_LOW_PERIOD_REG registers are used to configure the frequency and duty cycle of the signal on the SCL line.
- SDA_FSM: A state machine that controls the SDA data line.
- DATA_Shifter which converts the byte data to an outgoing bitstream, or converts an incoming bitstream to byte data. I2C_RX_LSB_FIRST and I2C_TX_LSB_FIRST can be used for configuring whether the LSB or MSB is stored or transmitted first.

- SCL_Filter and SDA_Filter: Input noise filter for the I2C_Slave. The filter can be enabled or disabled by configuring I2C_SCL_FILTER_EN and I2C_SDA_FILTER_EN. The filter can remove line glitches with pulse width less than I2C_SCL_FILTER_THRES and I2C_SDA_FILTER_THRES ABP clock cycles.

11.3.3 I2C Bus Timing

Figure 49: I2C Sequence Chart

Figure 49 is an I2C sequence chart. When the I2C controller works in master mode, SCL is an output signal. In contrast, when the I2C controller works in slave mode, the SCL becomes an input signal. The values assigned to I2C_SDA_HOLD_REG and I2C_SDA_SAMPLE_REG are still valid in slave mode. Users need to configure the values of I2C_SDA_HOLD_TIME and I2C_SDA_SAMPLE_TIME, according to the host characteristics, for the I2C slave to receive data properly.

According to the I2C protocol, each transmission of data begins with a START condition and ends with a STOP condition. Data is transmitted by one byte at a time, and each byte has an ACK bit. The receiver informs the transmitter to continue transmission by pulling down SDA, which indicates an ACK. The receiver can also indicate it wants to stop further transmission by pulling up the SDA line, thereby not indicating an ACK.

Figure 49 also shows the registers that can configure the START bit, STOP bit, SDA hold time, and SDA sample time.

If the I2C pads are configured in open-drain mode, it will take longer for the signal lines to transition from a low level to a high level. This will result in a poorly performing I2C bus. Proper external pull-up resistors are required on I2C signal lines for bus operation when I2C pads are configured in open-drain mode. Typically, a stronger pull-up is required for a higher frequency I2C bus operation.

11.3.4 I2C cmd Structure

Figure 50: Structure of The I2C Command Register

The Command register is active only in I2C master mode, with its internal structure shown in Figure 50.

CMD_DONE: The CMD_DONE bit of every command can be read by software to tell if the command has been handled by hardware.

op_code: op_code is used to indicate the command. The I2C controller supports four commands:

- **RSTART:** op_code = 0 is the RSTART command to control the transmission of a START or RESTART I2C condition.
- **WRITE:** op_code = 1 is the WRITE command for the I2C Master to transmit data.
- **READ:** op_code = 2 is the READ command for the I2C Master to receive data.
- **STOP:** op_code = 3 is the STOP command to control the transmission of a STOP I2C condition.
- **END:** op_code = 4 is the END command for continuous data transmission. When the END command is given, SCL is temporarily disabled to allow software to reload the command and data registers for subsequent events before resuming. Transmission will then continue seamlessly.

A complete data transmission process begins with an RSTART command, and ends with a STOP command.

ack_value: When receiving data, this bit is used to indicate whether the receiver will send an ACK after this byte has been received.

ack_exp: This bit is to set an expected ACK value for the transmitter.

ack_check_en: When transmitting a byte, this bit enables checking the ACK value received against the ack_exp value. Checking is enabled by 1, while 0 disables it.

byte_num: This register specifies the length of data (in bytes) to be read or written. The maximum length is 255, while the minimum is 1. When the op_code is RSTART, STOP or END, this value is meaningless.

11.3.5 I2C Master Writes to Slave

Figure 51: I2C Master Writes to Slave with 7-bit Address

In all subsequent figures that illustrate I2C transactions and behavior, both the I2C Master and Slave devices are assumed to be ESP32 I2C peripheral controllers for ease of demonstration.

Figure 51 shows the I2C Master writing N bytes of data to an I2C Slave. According to the I2C protocol, the first byte is the Slave address. As shown in the diagram, the first byte of the RAM unit has been populated with the Slave's 7-bit address plus the 1-bit read/write flag. In this case, the flag is zero, indicating a write operation. The

rest of the RAM unit holds N bytes of data ready for transmission. The cmd unit has been populated with the sequence of commands for the operation.

For the I2C master to begin an operation, the bus must not be busy, i.e. the SCL line must not be pulled low by another device on the I2C bus. The I2C operation can only begin when the SCL line is released (made high) to indicate that the I2C bus is free. After the cmd unit and data are prepared, I2C_TRANS_START bit in I2C_CTR_REG must be set to begin the configured I2C Master operation. The I2C Master then initiates a START condition on the bus and progresses to the WRITE command which will fetch N+1 bytes from RAM and send them to the Slave. The first of these bytes is the address byte.

When the transmitted data size exceeds I2C_NONFIFO_TX_THRES, an I2C_TX_SEND_EMPTY_INT interrupt will be generated. After detecting the interrupt, software can read TXFIFO_END_ADDR in register RXFIFO_ST_REG, get the last address of the data in the RAM and refresh the old data in the RAM. TXFIFO_END_ADDR will be refreshed each time interrupt I2C_TX_SEND_EMPTY_INT or I2C_TRANS_COMPLETE_INT occurs.

When ack_check_en is set to 1, the Master will check the ACK value each time it sends a data byte. If the ACK value received does not match ack_exp (the expected ACK value) in the WRITE command, then the Master will generate an I2C_ACK_ERR_INT interrupt and stop the transmission.

During transmission, when the SCL is high, if the input value and output value of SDA do not match, then the Master will generate an I2C_ARBITRATION_LOST_INT interrupt. When the transmission is finished, the Master will generate an I2C_TRANS_COMPLETE_INT interrupt.

After detecting the START bit sent from the Master, the Slave will start receiving the address and comparing it to its own. If the address does not match I2C_SLAVE_ADDR, then the Slave will ignore the rest of the transmission. If they do match, the Slave will store the rest of the data into RAM in the receiving order. When the data size exceeds I2C_NONFIFO_RX_THRES, an I2C_RX_REC_FULL_INT interrupt is generated. After detecting the interrupt, software will get the starting and ending addresses in the RAM by reading RXFIFO_START_ADDR and RXFIFO_END_ADDR bits in register RXFIFO_ST_REG, and fetch the data for further processing. Register RXFIFO_START_ADDR is refreshed only once during each transmission, while RXFIFO_END_ADDR gets refreshed every time when either I2C_RX_REC_FULL_INT or I2C_TRANS_COMPLETE_INT interrupt is generated.

When the END command is not used, the I2C master can transmit up to (14*255-1) bytes of valid data, and the cmd unit is populated with RSTART + 14 WRITE + 1 STOP.

There are several special cases to be noted:

- If the Master fails to send a STOP bit, because the SDA is pulled low by other devices, then the Master needs to be reset.
- If the Master fails to send a START bit, because the SDA or SCL is pulled low by other devices, then the Master needs to be reset. It is recommended that the software uses a timeout period to implement the reset.
- If the SDA is pulled low by the Slave during transmission, the Master can simply release it by sending it nine SCL clock signals at the most.

It is important to note that the behaviour of another I2C master or slave device on the bus may not always be similar to that of the ESP32 I2C peripheral in the master- or slave-mode operation described above. Please consult the datasheets of the respective I2C devices to ensure proper operation under all bus conditions.

Figure 52: I2C Master Writes to Slave with 10-bit Address

The ESP32 I2C controller uses 7-bit addressing by default. However, 10-bit addressing can also be used. In the master, this is done by sending a second I2C address byte after the first address byte. In the slave, the I2C_SLAVE_ADDR_10BIT_EN bit in I2C_SLAVE_ADDR_REG can be set to activate a 10-bit addressing mode. I2C_SLAVE_ADDR is used to configure the I2C Slave address, as per usual. Figure 52 shows the equivalent of I2C Master operation writing N-bytes of data to an I2C Slave with a 10-bit address. Since 10-bit Slave addresses require an extra address byte, both the byte_num field of the WRITE command and the number of total bytes in RAM increase by one.

When the END command is not used, the I2C master can transmit up to (14*255-2) bytes of valid data to Slave with 10-bit address.

Figure 53: I2C Master Writes to addrM in RAM of Slave with 7-bit Address

One way many I2C Slave devices are designed is by exposing a register block containing various settings. The I2C Master can write one or more of these registers by sending the Slave a register address. The ESP32 I2C Slave controller has hardware support for such a scheme.

Specifically, on the Slave, I2C_FIFO_ADDR_CFG_EN can be set so that the I2C Master can write to a specified register address inside the I2C Slave memory block. Figure 53 shows the I2C Master writing N-bytes of data byte0 ~ byte(N-1) from the RAM unit to register address M (determined by addrM in RAM unit) with the Slave. In this mode, I2C Slave can receive up to 32 bytes of valid data. When I2C Master needs to transmit extra amount of data, segmented transmission can be enabled.

Figure 54: I2C Master Writes to Slave with 7-bit Address in Three Segments

If the data size exceeds the capacity of a 14-byte read/write cmd, the END command can be called to enable segmented transmission. Figure 54 shows the I2C Master writing data to the Slave, in three segments. The first segment shows the configuration of the Master's commands and the preparation of data in the RAM unit. When the `I2C_TRANS_START` bit is enabled, the Master starts transmission. After executing the END command, the Master will turn off the SCL clock and pull the SCL low to reserve the I2C bus and prevent any other device from transacting on the bus. The controller will generate an `I2C_END_DETECT_INT` interrupt to notify the software.

After detecting an `I2C_END_DETECT_INT` interrupt, the software can refresh the contents of the cmd and RAM blocks, as shown in the second segment. Subsequently, it should clear the `I2C_END_DETECT_INT` interrupt and resume the transaction by setting the `I2C_TRANS_START` bit. To stop the transaction, it should configure the cmd, as the third segment shows, and enable the `I2C_TRANS_START` bit to generate a STOP bit, after detecting the `I2C_END_DETECT_INT` interrupt.

Please note that the other masters on the I2C bus will be starved of bus time between two segments. The bus is only released after a STOP signal is sent.

Note: When there are more than three segments, the address of an END command in the cmd should not be altered into another command by the next segment.

11.3.6 I2C Master Reads from Slave

Figure 55: I2C Master Reads from Slave with 7-bit Address

Figure 55 shows the I2C Master reading N-bytes of data from an I2C Slave with a 7-bit address. At first, the I2C Master needs to send the address of the I2C Slave, so cmd1 is a WRITE command. The byte that this command sends is the I2C slave address plus the R/W flag, which in this case is 1 and, therefore, indicates that this is going to be a read operation. The I2C Slave starts to send data to the Master if the addresses match. The Master will return ACK, according to the ack_value in the READ command, upon receiving every byte. As can be seen from Figure 55, READ is divided into two segments. The I2C Master replies ACK to N-1 bytes in cmd2 and does not reply ACK to the single byte READ command in cmd3, i.e., the last transmitted data. Users can configure it as they wish.

When storing the received data, I2C Master will start from the first address in RAM. Byte0 (Slave address + 1-bit R/W marker bit) will be overwritten.

When the END command is not used, the I2C Master can transmit up to (13*255) bytes of valid data. The cmd unit is populated with RSTART + 1 WRITE + 13 READ + 1 STOP.

Figure 56: I2C Master Reads from Slave with 10-bit Address

Figure 56 shows the I2C Master reading data from a slave with a 10-bit address. This mode can be enabled by setting I2C_SLAVE_ADDR_10BIT_EN bit and preparing data to be sent in the slave RAM. In the Master, two bytes of RAM are used for a 10-bit address. Finally, the I2C_TRANS_START bit must be set to enable one transaction.

Figure 57: I2C Master Reads N Bytes of Data from addrM in Slave with 7-bit Address

Figure 57 shows the I2C Master reading data from a specified address in the I2C Slave. This mode can be enabled by setting `I2C_FIFO_ADDR_CFG_EN` and preparing the data to be read by the master in the Slave RAM block. Subsequently, the address of the Slave and the address of the specified register (that is, M) have to be determined by the master. Finally, the `I2C_TRANS_START` bit must be set in the Master to initiate the read operation, following which the I2C Slave will fetch N bytes of data from RAM and send them to the Master.

Figure 58: I2C Master Reads from Slave with 7-bit Address in Three Segments

Figure 58 shows the I2C Master reading N+M bytes of data in three segments from the I2C Slave. The first segment shows the configuration of the cmd and the preparation of data in the Slave RAM. When the I2C_TRANS_START bit is enabled, the I2C Master starts the operation. The I2C Master will refresh the cmd after executing the END command. It will clear the I2C_END_DETECT_INT interrupt, set the I2C_TRANS_START bit and resume the transaction. To stop the transaction, the I2C Master will configure the cmd, as the third segment shows, after detecting the I2C_END_DETECT_INT interrupt. After setting the I2C_TRANS_START bit, I2C Master will send a STOP bit to stop the transaction.

11.3.7 Interrupts

- I2C_TX_SEND_EMPTY_INT: Triggered when the I2C has sent nonfifo_tx_thres bytes of data.
- I2C_RX_REC_FULL_INT: Triggered when the I2C has received nonfifo_rx_thres bytes of data.
- I2C_ACK_ERR_INT: Triggered when the I2C Master receives an ACK that is not as expected, or when the I2C Slave receives an ACK whose value is 1.
- I2C_TRANS_START_INT: Triggered when the I2C sends the START bit.
- I2C_TIME_OUT_INT: Triggered when the SCL stays high or low for more than I2C_TIME_OUT clocks.
- I2C_TRANS_COMPLETE_INT: Triggered when the I2C detects a STOP bit.
- I2C_MASTER_TRAN_COMP_INT: Triggered when the I2C Master sends or receives a byte.
- I2C_ARBITRATION_LOST_INT: Triggered when the I2C Master's SCL is high, while the output value and input value of the SDA do not match.
- I2C_SLAVE_TRAN_COMP_INT: Triggered when the I2C Slave detects a STOP bit.
- I2C_END_DETECT_INT: Triggered when the I2C deals with the END command.

11.4 Register Summary

Name	Description	I2C0	I2C1	Acc
Configuration registers				
I2C_SLAVE_ADDR_REG	Configures the I2C slave address	0x3FF53010	0x3FF67010	R/W
I2C_RXFIFO_ST_REG	FIFO status register	0x3FF53014	0x3FF67014	RO
I2C_FIFO_CONF_REG	FIFO configuration register	0x3FF53018	0x3FF67018	R/W
Timing registers				
I2C_SDA_HOLD_REG	Configures the hold time after a negative SCL edge	0x3FF53030	0x3FF67030	R/W
I2C_SDA_SAMPLE_REG	Configures the sample time after a positive SCL edge	0x3FF53034	0x3FF67034	R/W
I2C_SCL_LOW_PERIOD_REG	Configures the low level width of the SCL clock	0x3FF53000	0x3FF67000	R/W
I2C_SCL_HIGH_PERIOD_REG	Configures the high level width of the SCL clock	0x3FF53038	0x3FF67038	R/W
I2C_SCL_START_HOLD_REG	Configures the delay between the SDA and SCL negative edge for a start condition	0x3FF53040	0x3FF67040	R/W
I2C_SCL_RSTART_SETUP_REG	Configures the delay between the positive edge of SCL and the negative edge of SDA	0x3FF53044	0x3FF67044	R/W
I2C_SCL_STOP_HOLD_REG	Configures the delay after the SCL clock edge for a stop condition	0x3FF53048	0x3FF67048	R/W
I2C_SCL_STOP_SETUP_REG	Configures the delay between the SDA and SCL positive edge for a stop condition	0x3FF5304C	0x3FF6704C	R/W
Filter registers				
I2C_SCL_FILTER_CFG_REG	SCL filter configuration register	0x3FF53050	0x3FF67050	R/W
I2C_SDA_FILTER_CFG_REG	SDA filter configuration register	0x3FF53054	0x3FF67054	R/W
Interrupt registers				
I2C_INT_RAW_REG	Raw interrupt status	0x3FF53020	0x3FF67020	RO
I2C_INT_ENA_REG	Interrupt enable bits	0x3FF53028	0x3FF67028	R/W
I2C_INT_CLR_REG	Interrupt clear bits	0x3FF53024	0x3FF67024	WO
Command registers				
I2C_COMD0_REG	I2C command register 0	0x3FF53058	0x3FF67058	R/W
I2C_COMD1_REG	I2C command register 1	0x3FF5305C	0x3FF6705C	R/W
I2C_COMD2_REG	I2C command register 2	0x3FF53060	0x3FF67060	R/W
I2C_COMD3_REG	I2C command register 3	0x3FF53064	0x3FF67064	R/W
I2C_COMD4_REG	I2C command register 4	0x3FF53068	0x3FF67068	R/W
I2C_COMD5_REG	I2C command register 5	0x3FF5306C	0x3FF6706C	R/W
I2C_COMD6_REG	I2C command register 6	0x3FF53070	0x3FF67070	R/W
I2C_COMD7_REG	I2C command register 7	0x3FF53074	0x3FF67074	R/W
I2C_COMD8_REG	I2C command register 8	0x3FF53078	0x3FF67078	R/W
I2C_COMD9_REG	I2C command register 9	0x3FF5307C	0x3FF6707C	R/W
I2C_COMD10_REG	I2C command register 10	0x3FF53080	0x3FF67080	R/W
I2C_COMD11_REG	I2C command register 11	0x3FF53084	0x3FF67084	R/W
I2C_COMD12_REG	I2C command register 12	0x3FF53088	0x3FF67088	R/W

Name	Description	I2C0	I2C1	Acc
I2C_COMD13_REG	I2C command register 13	0x3FF5308C	0x3FF6708C	R/W
I2C_COMD14_REG	I2C command register 14	0x3FF53090	0x3FF67090	R/W
I2C_COMD15_REG	I2C command register 15	0x3FF53094	0x3FF67094	R/W

11.5 Registers

Register 11.1: I2C_SCL_LOW_PERIOD_REG (0x0000)

(reserved)														I2C_SCL_LOW_PERIOD																	
31														14	13																0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reset

I2C_SCL_LOW_PERIOD This register is used to configure for how long SCL remains low in master mode, in APB clock cycles. (R/W)

Register 11.2: I2C_CTR_REG (0x0004)

(reserved)														I2C_CTR_REG													I2C_SDA_FORCE_OUT		
31								8	7	6	5	4	3	2	1	0													
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Reset

I2C_RX_LSB_FIRST This bit is used to control the storage mode for received data. (R/W)

- 1: receive data from the least significant bit;
- 0: receive data from the most significant bit.

I2C_TX_LSB_FIRST This bit is used to control the sending mode for data needing to be sent. (R/W)

- 1: send data from the least significant bit;
- 0: send data from the most significant bit.

I2C_TRANS_START Set this bit to start sending the data in txfifo. (R/W)

I2C_MS_MODE Set this bit to configure the module as an I2C Master. Clear this bit to configure the module as an I2C Slave. (R/W)

I2C_SAMPLE_SCL_LEVEL 1: sample SDA data on the SCL low level; 0: sample SDA data on the SCL high level. (R/W)

I2C_SCL_FORCE_OUT 0: direct output; 1: open drain output. (R/W)

I2C_SDA_FORCE_OUT 0: direct output; 1: open drain output. (R/W)

286

I2C_ACK_REC This register stores the value of the received ACK bit. (RO)

I2C_TIME_OUT_REG This register is used to configure the timeout for receiving a data bit in APB clock cycles. (R/W)

Register 11.7: I2C_FIFO_CONF_REG (0x0018)

(reserved)						I2C_NONFIFO_TX_THRES					I2C_NONFIFO_RX_THRES					(reserved)		I2C_FIFO_ADDR_CFG_EN		I2C_NONFIFO_EN	
31		26	25		20	19		14	13	12	11	10									
0	0	0	0	0	0	0	0x15	0x15	0	0	0	0									Reset

I2C_NONFIFO_TX_THRES When I2C sends more than nonfifo_tx_thres bytes of data, it will generate a tx_send_empty_int_raw interrupt and update the current offset address of the sent data. (R/W)

I2C_NONFIFO_RX_THRES When I2C receives more than nonfifo_rx_thres bytes of data, it will generate a rx_send_full_int_raw interrupt and update the current offset address of the received data. (R/W)

I2C_FIFO_ADDR_CFG_EN When this bit is set to 1, the byte received after the I2C address byte represents the offset address in the I2C Slave RAM. (R/W)

I2C_NONFIFO_EN Set this bit to enable APB nonfifo access. (R/W)

Register 11.8: I2C_INT_RAW_REG (0x0020)

(reserved)																								I2C_TX_SEND_EMPTY_INT_RAW I2C_RX_REC_FULL_INT_RAW I2C_ACK_ERR_INT_RAW I2C_TRANS_START_INT_RAW I2C_TIME_OUT_INT_RAW I2C_TRANS_COMPLETE_INT_RAW I2C_MASTER_TRAN_COMP_INT_RAW I2C_ARBITRATION_LOST_INT_RAW I2C_END_DETECT_INT_RAW

Reset

I2C_SCL_STOP_SETUP_TIME This register is used to configure the time between the positive edge of SCL and the positive edge of SDA, in APB clock cycles. (R/W)

I2C_SCL_FILTER_EN This is the filter enable bit for SCL. (R/W)

I2C_SCL_FILTER_THRES When a pulse on the SCL input has smaller width than this register value in APB clock cycles, the I2C controller will ignore that pulse. (R/W)

Register 11.20: I2C_SDA_FILTER_CFG_REG (0x0054)

I2C_SDA_FILTER_EN This is the filter enable bit for SDA. (R/W)

I2C_SDA_FILTER_THRES When a pulse on the SDA input has smaller width than this register value in APB clock cycles, the I2C controller will ignore that pulse. (R/W)

Register 11.21: I2C_COMD_n_REG (*n*: 0-15) (0x58+4n*)**

I2C_COMMAND n _DONE When command n is done in I2C Master mode, this bit changes to high level. (R/W)

I2C_COMMAND*n* This is the content of command *n*. It consists of three parts: (R/W)
op_code is the command, 0: RSTART; 1: WRITE; 2: READ; 3: STOP; 4: END.
Byte_num represents the number of bytes that need to be sent or received.
ack_check_en, ack_exp and ack are used to control the ACK bit. See [I2C cmd structure](#) for more information.

12. I2S

12.1 Overview

The I2S bus provides a flexible communication interface for streaming digital data in multimedia applications, especially digital audio applications. The ESP32 includes two I2S interfaces: I2S0 and I2S1.

The I2S standard bus defines three signals: a clock signal, a channel selection signal, and a serial data signal. A basic I2S data bus has one master and one slave. The roles remain unchanged throughout the communication. The I2S modules on the ESP32 provide separate transmit and receive channels for high performance.

Figure 59: I2S System Block Diagram

Figure 59 is the system block diagram of the ESP32 I2S module. In the figure above, the value of "*n*" can be either 0 or 1. There are two independent I2S modules embedded in ESP32, namely I2S0 and I2S1. Each I2S module contains a Tx (transmit) unit and a Rx (receive) unit. Both the Tx unit and the Rx unit have a three-wire interface that includes a clock line, a channel selection line and a serial data line. The serial data line of the Tx unit is fixed as output, and the serial data line of the receive unit is fixed as input. The clock line and the channel selection line of the Tx and Rx units can be configured to both master transmitting mode and slave receiving mode. In the LCD mode, the serial data line extends to the parallel data bus. Both the Tx unit and the Rx unit have a 32-bit-wide FIFO with a depth of 64. Besides, only I2S0 supports on-chip DAC/ADC modes, as well as receiving and transmitting PDM signals.

The right side of Figure 59 shows the signal bus of the I2S module. The signal naming rule of the Rx and Tx units is I2SnA_B_C, where "*n*" stands for either I2S0 or I2S1; "A" represents the direction of I2S module's data bus signal, "I" represents input, "O" represents output; "B" represents signal function; "C" represents the signal direction, "in" means that the signal is input into the I2S module, while "out" means that the I2S module outputs the signal. For a detailed description of the I2S signal bus, please refer to Table 56.

Table 56: I2S Signal Bus Description

Signal Bus	Signal Direction	Data Signal Direction
I2SnI_BCK_in	In slave mode, I2S module accepts signals.	I2S module receives data.
I2SnI_BCK_out	In master mode, I2S module outputs signals.	I2S module receives data.
I2SnI_WS_in	In slave mode, I2S module accepts signals.	I2S module receives data.
I2SnI_WS_out	In master mode, I2S module outputs signals.	I2S module receives data.
I2SnI_Data_in	I2S module accepts signals.	In I2S mode, I2SnI_Data_in[15] is the serial data bus of I2S. In LCD mode, the data bus width can be configured as needed.
I2SnO_Data_out	I2S module outputs signals.	In I2S mode, I2SnO_Data_out[23] is the serial data bus of I2S. In LCD mode, the data bus width can be configured as needed.
I2SnO_BCK_in	In slave mode, I2S module accepts signals.	I2S module sends data.
I2SnO_BCK_out	In master mode, I2S module outputs signals.	I2S module sends data.
I2SnO_WS_in	In slave mode, I2S module accepts signals.	I2S module sends data.
I2SnO_WS_out	In master mode, I2S module outputs signals.	I2S module sends data.
I2Sn_CLK	I2S module outputs signals.	It is used as a clock source for peripheral chips.
I2Sn_H_SYNC	In Camera mode, I2S module accepts signals.	The signals are sent from the Camera.
I2Sn_V_SYNC		
I2Sn_H_ENABLE		

Table 56 describes the signal bus of the I2S module. Except for the I2Sn_CLK signal, all other signals are mapped to the chip pin via the GPIO matrix and IO MUX. The I2Sn_CLK signal is mapped to the chip pin via the IO_MUX. For details, please refer to the chapter about [IO_MUX](#) and the [GPIO Matrix](#).

12.2 Features

I2S mode

- Configurable high-precision output clock
- Full-duplex and half-duplex data transmit and receive modes
- Supports multiple digital audio standards
- Embedded A-law compression/decompression module
- Configurable clock signal
- Supports PDM signal input and output
- Configurable data transmit and receive modes

LCD mode

- Supports multiple LCD modes, including external LCD
- Supports external Camera

- Supports on-chip DAC/ADC modes

I2S interrupts

- Standard I2S interface interrupts
- I2S DMA interface interrupts

12.3 The Clock of I2S Module

As is shown in Figure 60, I2S_n_CLK, as the master clock of I2S module, is derived from the 160 MHz clock PLL_D2_CLK or the configurable analog PLL output clock APLL_CLK. The serial clock (BCK) of the I2S module is derived from I2S_n_CLK. The I2S_CLKA_ENA bit of register I2S_CLKM_CONF_REG is used to select either PLL_D2_CLK or APLL_CLK as the clock source for I2S_n. PLL_D2_CLK is used as the clock source for I2S_n, by default.

Notice:

- When using PLL_D2_CLK as the clock source, it is not recommended to divide it using decimals. For high performance audio applications, the analog PLL output clock source APLL_CLK must be used to acquire highly accurate I2S_n_CLK and BCK. For further details, please refer to the chapter entitled [Reset and Clock](#).
- When ESP32 I2S works in slave mode, the master must use I2S_n_CLK as the master clock and $f_{i2s} \geq 8 * f_{BCK}$.

Figure 60: I2S Clock

The relation between I2S_n_CLK frequency f_{i2s} and the divider clock source frequency f_{pll} can be seen in the equation below:

$$f_{i2s} = \frac{f_{pll}}{N + \frac{b}{a}}$$

"N", whose value is ≥ 2 , corresponds to the REG_CLKM_DIV_NUM [7: 0] bits of register I2S_CLKM_CONF_REG, "b" is the I2S_CLKM_DIV_B[5:0] bit and "a" is the I2S_CLKM_DIV_A[5:0] bit.

In master mode, the serial clock BCK in the I2S module is derived from I2S_n_CLK, that is:

$$f_{BCK} = \frac{f_{i2s}}{M}$$

In master transmitting mode, "M", whose value is ≥ 2 , is the I2S_TX_BCK_DIV_NUM[5:0] bit of register I2S_SAMPLE_RATE_CONF_REG. In master receiving mode, "M" is the I2S_RX_BCK_DIV_NUM[5:0] bit of register I2S_SAMPLE_RATE_CONF_REG.

12.4 I2S Mode

The ESP32 I2S module integrates an A-law compression/decompression module to enable compression/decompression of the received audio data. The RX_PCM_BYPASS bit and the TX_PCM_BYPASS bit of register I2S_CONF1_REG should be cleared when using the A-law compression/decompression module.

12.4.1 Supported Audio Standards

In the I2S bus, BCK is the serial clock, WS is the left- /right-channel selection signal (also called word select signal), and SD is the serial data signal for transmitting/receiving digital audio data. WS and SD signals in the I2S module change on the falling edge of BCK, while the SD signal can be sampled on the rising edge of BCK. If the I2S_RX_RIGHT_FIRST bit and the I2S_TX_RIGHT_FIRST bit of register I2S_CONF_REG are set to 1, the I2S module is configured to receive and transmit right-channel data first. Otherwise, the I2S module receives and transmits left-channel data first.

12.4.1.1 Philips Standard

Figure 61: Philips Standard

As is shown in Figure 61, the Philips I2S bus specifications require that the WS signal starts to change a BCK clock cycle earlier than the SD signal, which means that the WS signal takes effect a clock cycle before the first bit of the current channel-data transmission, while the WS signal continues until the end of the current channel-data transmission. The SD signal line transmits the most significant bit of audio data first. If the I2S_RX_MSB_SHIFT bit and the I2S_TX_MSB_SHIFT bit of register I2S_CONF_REG are set to 1, respectively, the I2S module will use the Philips standard when receiving and transmitting data.

12.4.1.2 MSB Alignment Standard

Figure 62: MSB Alignment Standard

The MSB alignment standard is shown in Figure 62. WS and SD signals both change simultaneously on the falling edge of BCK under the MSB alignment standard. The WS signal continues until the end of the current channel-data transmission, and the SD signal line transmits the most significant bit of audio data first. If the I2S_RX_MSB_SHIFT and I2S_TX_MSB_SHIFT bits of register I2S_CONF_REG are cleared, the I2S module will use the MSB alignment standard when receiving and transmitting data.

12.4.1.3 PCM Standard

As is shown in Figure 63, under the short frame synchronization mode of the PCM standard, the WS signal starts to change a BCK clock cycle earlier than the SD signal, which means that the WS signal takes effect a clock cycle earlier than the first bit of the current channel-data transmission and continues for one extra BCK clock cycle. The SD signal line transmits the most significant bit of audio data first. If the I2S_RX_SHORT_SYNC and I2S_TX_SHORT_SYNC bits of register I2S_CONF_REG are set, the I2S module will receive and transmit data in the short frame synchronization mode.

Figure 63: PCM Standard

12.4.2 Module Reset

The four low-order bits in register I2S_CONF_REG, that is, I2S_TX_RESET, I2S_RX_RESET, I2S_TX_FIFO_RESET and I2S_RX_FIFO_RESET reset the receive module, the transmit module and the corresponding FIFO buffer, respectively. In order to finish a reset operation, the corresponding bit should be set and then cleared by software.

12.4.3 FIFO Operation

The data read/write packet length for a FIFO operation is 32 bits. The data packet format for the FIFO buffer can be configured using configuration registers. As shown in Figure 59, both sent and received data should be written into FIFO first and then read from FIFO. There are two approaches to accessing the FIFO; one is to directly access the FIFO using a CPU, the other is to access the FIFO using a DMA controller.

Generally, both the I2S_RX_FIFO_MOD_FORCE_EN bit and I2S_TX_FIFO_MOD_FORCE_EN bits of register I2S_FIFO_CONF_REG should be set to 1. I2S_TX_DATA_NUM[5:0] bit and I2S_RX_DATA_NUM[5:0] are used to control the length of the data that have been sent, received and buffered. Hardware inspects the received-data length RX_LEN and the transmitted-data length TX_LEN. Both the received and the transmitted data are buffered in the FIFO method.

When RX_LEN is greater than I2S_RX_DATA_NUM[5:0], the received data, which is buffered in FIFO, has reached the set threshold and needs to be read out to prevent an overflow. When TX_LEN is less than I2S_TX_DATA_NUM[5:0], the transmitted data, which is buffered in FIFO, has not reached the set threshold and software can continue feeding data into FIFO.
