- Introduction
- Antenna Locations
- Measurement Architecture
 - Setup Details
 - Chamber Calibrations
 - Chamber Validations
 - DUT Setup
 - Chamber Calibration certified by MVG
- S-Parameters
- Efficiency and Peak Gain
- Peak gain directions
- Composite Gain
- 2D Radiation Patterns
- Heatmap and 3D Plots
- Appendix—Pre-Approval Guidance

- This passive report describes the performance of Airgain AC Fleet 5G Vehicle Gateway
- The seven antennas integrated:
 - 2 Cell elements covering 5G/LTE cellular bands from 617MHz – 6000MHz
 - 2 Cell elements covering 5G/LTE cellular bands from 1700MHz – 6000MHz
 - 2 Wi-Fi elements covering from 2.4-2.49GHz, 5.15-5.85GHz and 5.925-7.125GHz WiFi Band
 - One Bluetooth antenna covering from 2.4GHz-2.49GHz band of operation
- 2 Cell elements are flex film mounted on a plastic carrier
- 2 Cell elements are PCB antenna mounted on PCBA
- 2 Wi-Fi and one Bluetooth antennas are stamped metal antenna mounted on heatsink
- All antennas use a 1.37mm coaxial cable, Cable lengths are mentioned in the report
- All measurements recorded and depicted in this report have cable losses included and was measured in free space

Antenna List

No	Antenna PN	Bands Covered	Cable lengths (mm)/Cable /Connector	Antenna type	Antenna Manufacturer
Cell 1	CH56AGDKZ F56AGDKA-LB1X132BU4LI	<u>5G/LTE</u> : LB,MB, UHB C,LAA	132mm - 1.37 Low Loss MHF-4L	Monopole	Airgain
Cell 2	CH56AGDKZ F56AGDKB-LB1X130BU4LI	<u>5G/LTE</u> : LB,MB, UHB C, LAA	130mm - 1.37 Low Loss MHF-4L	Monopole	Airgain
Cell 3	N54AGDKC-LY1X255BU4LI	<u>5G/LTE</u> : MB, UHB C, LAA	255mm - 1.37 Low Loss MHF-4L	Monopole	Airgain
Cell 4	N54AGDKJ-LE1X272BU4LI	<u>5G/LTE</u> : MB, UHB C,LAA, <u>GNSS</u> :L1	272mm - 1.37 Low Loss MHF-4L	Monopole	Airgain
Bluetooth BT	M03AGDKG-LK1X137BU	Bluetooth 2.4-2.49GHz	137mm - 1.37 U.FL	Monopole	Airgain

Item	Value
Frequency range	Depending on the frequency band(s) provided by the network operator, the customer must use the most suitable antenna for that/those band(s). The bands supported by the FN990 Family are provided in Section 2.2 Frequency Bands and CA / EN-DC Combinations
Impedance	50 Ohm
Input power	> 24 dBm average power in WCDMA & LTE & 5G Sub-6
VSWR absolute max	$\leq 10:1$
VSWR recommended	$\leq 2:1$

Antenna Measurement Architecture

Measurement setup Architecture

- Starlab uses an Active Switching Unit to switch between near-field passive measurement and OTA measurement
- For near-field passive measurement a Vector Network analyzer is used as RF source/receiver
- The power and control unit supplies the power and driver the RF units on the arch
- Starlab performs a over sampling by mechanically rotating the arch by $\pm 11.25^\circ$ in elevation
- The software translates the measured near-field into far-field
- All the AUT/DUT are measured with phase center located in the quite zone of the chamber for calibration, Validation and performance evaluation
- Starlab can accommodate AUT/DUT up to 45 cm in diameter

Passive Antenna Calibration Setup

- Starlab is calibrated on a monthly basis by using MVG calibration method
- A standard Satimo horn antenna SH600 and SH2000 are used for calibrating the changer in low and high frequency bands of operation
- The horn antennas are measured in the chamber and the calibration is performed in post processing with reference to standard gain values of the horn which are certified and provided by MVG
- During postposing a **gain substitution** method is used and the measured gain/efficiency data is computed against the standard gain/efficiency values of the horn antenna and a new calibration file is generated
- The calibrated file generated is stored as a new primary calibration file which will be recalled automatically during post processing of any AUT/DUT measurements

Passive Antenna Validation Dipoles

Passive Antenna Validation Setup

SD2600

- Starlab is validated after the calibration process is completed, and a routine validation is performed every week to ensure the calibration has not been drifted over the time.
- Standard Satimo dipoles are measured in different frequency range based upon the dipole specs.
- Standard dipole include SD900, SD1800, SD1900, SD1900, SD2050, SD2450, SD2600, SD5150, SD5650
- Dipoles are measured and post processed with standard AUT/DUT measurement steps
- Upon postprocessing the output gain and efficiency of the dipole is compared to the standard dipole data provided and certified by MVG/Satimo
- If the measured values are out of limit a new calibration is performed if needed

Passive Antenna Validation Results

- MVG visits on site every year and performs a full set of system calibration which is valid for a year
- During the calibration and validation process MVG checks the performance of the full system and ensures the measured/validated data is in the tolerance limit of Starlab specs

Antenna System Composite Gain

- The composite gain is based on FCC document 662911. Part d (ii)

d) *Unequal antenna gains, with equal transmit powers.* For antenna gains given by $G_1, G_2, \dots, G_N$ dBi

- (i) If transmit signals are *correlated*, then

Directional gain = $10 \log[(10^{G_1/20} + 10^{G_2/20} + \dots + 10^{G_N/20})^2 / N_{\text{ANT}}]$ dBi [Note the “20”s in the denominator of each exponent and the square of the sum of terms; the object is to combine the signal levels coherently.]

- (ii) If all transmit signals are *completely uncorrelated*, then

Directional gain = $10 \log[(10^{G_1/10} + 10^{G_2/10} + \dots + 10^{G_N/10}) / N_{\text{ANT}}]$ dBi
