Foreword

The EUT contains the BLE module «U-BLOX ANNA-B112» with FCC ID: XPYANNAB1. The radio module which is included in the EUT has been tested by its manufacturer in accordance with the relevant rules and standards. Therefore these tests have not been carried out again. According to XC Tracer GmbH, this BLE radio module is installed in accordance with the instructions of its manufacturer.

The radio service FLARM and LoRa use the same radio module «Murata 1SJ-295». Only one radio service can be active at once, as the same internal amplifier is used. The FLARM and LoRa mode has been measured completely.

The XC-Tracer Maxx II devices communicate among each other based on LoRa transmission packets. However the channel frequencies used are different. In LoRa mode, the Murata module is only accredited for the frequency range from 902 – 915 MHz. As the full frequency range from 902-928 MHz was needed, the LoRa mode has been measured completely too.

In 2022-05-11 a firmware change was necessary to correct the number of hopping channels for the FLARM radio service.

The LoRa module «Murata 1SJ-295» has the FCC ID: VPYLB0QB1SJ for the frequency range 902-915 MHz
According Murata the Modules 1SJ-295 and 1SJ-296 have identical hardware.

Report Updates:

Report 21CH-01312.R02: Contains only the fully measurements for the FLARM mode.

Report 21CH-01312.R12: The complete measurement for LoRa mode with frequency range 902-928 MHz has been added.

Report 21CH-01312.R22: The antenna gain has been adapted to the XC-Tracer Maxx II Antenna report

1. Summary of test results

1.1 Mode FLARM (47 CFR Part 15.247)

§	Test Type	Result
6	Emission	CFR 47 Part 15
6.1	Channel 20dB-bandwidth	CFR 47 § 15.247 (a)(1) 204 kHz
6.1.2	Carrier frequency separation	CFR 47 § 15.247 (a)(1) Pass (400 kHz)
6.1.3	Number of hopping channels	CFR 47 § 15.247 (a)(1)(iii) Pass (n = 63)
6.1.4	Time of occupancy (dwell time)	CFR 47 § 15.247 (a)(1)(iii) Pass
6.1.5	Pseudorandom frequency hopping sequence and equal hopping frequency use	CFR 47 § 15.247 (a)(1) Pass ¹
6.1.6	Antenna gain (& effective radiated power)	CFR 47 § 15.247 (b)(4) Pass (3.6 dBi)
6.1.7	Maximum output power (conducted)	CFR 47 § 15.247 (b)(1) Pass (16.8 dBm)
6.1.8	Band-edge emission (conducted)	CFR 47 § 15.247 (d) Pass
6.1.9	Spurious emissions – conducted (transmitter)	CFR 47 § 15.247 (d) Pass
6.1.10	Spurious emissions – radiated (transmitter)	CFR 47 § 15.247 (d) CFR 47 § 15.209 (a) CFR 47 § 15.205 Pass
6.1.11	Radiated emission – receiver	CFR 47 § 15.109 Pass
6.3	Conducted emission	CFR 47 § 15.207 Pass ²
6	Emission	CFR 47 Part 2
6.4	Designation of emission	FCC 47 §2.201 FCC 47 §2.202 200KFXD

1. Declared by manufacturer
2. Tested in mode charging (in charging mode there is no radio service possible)

1.2 Mode LoRa (47 CFR Part 15.247)

§	Test Type	Result
6	Emission	CFR 47 Part 15
6.2.1	Antenna requirement	CFR 47 § 15.203 Pass
6.2.2	Channel 6 dB Bandwidth	CFR 47 § 15.247 (a) Pass
6.2.3	Duty Cycle	CFR 47 § 15.247 (a)(1)(iii) Pass
6.2.4	Maximum output power (conducted)	CFR 47 § 15.247 (b) Pass (16.8 dBm)
6.2.5	Band-edge emission (conducted)	CFR 47 § 15.247 (d) Pass
6.2.6	Power spectral density – conducted (transmitter)	CFR 47 § 15.247 (e) Pass
6.2.7	Spurious emissions – radiated (transmitter)	CFR 47 § 15.247 (d) CFR 47 § 15.209 (a) CFR 47 § 15.205 Pass
6.2.8	Radiated emission – receiver	CFR 47 § 15.109 Pass
6.3	Conducted emission	CFR 47 § 15.207 Pass ²

1. Tested in mode FLARM
2. Tested in mode charging (in charging mode there is no radio service possible)

2. Applied standards

47 CFR Part 15 Subpart C	Code of Federal Regulations - Title 47 - Telecommunication, Part 15, Subpart C: "Intentional Radiators"
47 CFR Part 15 Subpart B	Code of Federal Regulations - Title 47 - Telecommunication, Part 15, Subpart B: "Unintentional Radiators"

3. Applicant

4. Equipment under test

4.1 Identification*

Manufacturer name and address	XC Tracer GmbH Junkerngasse 53 3011 Bern SWITZERLAND
Production country	Switzerland
Brand name	XC Tracer
Product	XC Tracer Maxx II
Product description	Flight instrument for Paragliders & Hanggliders
Model number	XC Tracer Maxx II
Serial no	2000C8, 2000C9
Software version	maxxii_radio_firmware_20220412_0_9_7.efw (FLARM) and maxxii_radio_firmware_20220511_0_9_16.efw (LoRa)
FCC ID	2AVOQ02
Lowest Frequency considered	20 kHz (charge pump for LED driver)
Highest frequency considered	48 MHz (CPU) / 927.4 MHz (FLARM Transmitter carrier)
Supply	U = 3.7 VDC / I = 30 mA (from Battery) U = 5 VDC / I _{max} = 0.5 A (for charging the Battery on USB port)
Dimension	~ 9.5 cm x 2 cm x 7 cm (l x w x h)
Weight	~ 0.12 kg
Technical	None. The equipment is completely identified by the above-mentioned information. XC Tracer GmbH assures the traceability of the documentation and is responsible for the product identification.

* According to information provided by XC Tracer GmbH and not verified by Eurofins Electric & Electronic Product Testing AG

4.3 Classification

CFR 47 Part 15	☒ Unintentional radiator (Subpart B), Receive and charging modes ☐ Class A digital device ☒ Class B digital device ☒ The highest frequency of the internal sources of the EUT is less than 108 MHz (measurement shall be made up to 1 GHz). ☐ The highest frequency of the internal sources of the EUT is between 108 MHz and 500 MHz (measurement shall be made up to 2 GHz). ☐ The highest frequency of the internal sources of the EUT is between 500 MHz and 1 GHz (measurement shall be made up to 5 GHz). ☐ The highest frequency of the internal sources of the EUT is above 1 GHz (measurement shall be made up to 5 times the highest frequency or 40 GHz, whichever is lower). ☒ Intentional radiator (Subpart C), Transmit mode ☒ The highest fundamental frequency of the EUT is less than 10 GHz (measurement shall be made up to the tenth harmonic or 40 GHz, whichever is lower). ☐ The highest fundamental frequency of the EUT is between 10 GHz and 30 GHz (measurement shall be made up to the fifth harmonic or 100 GHz, whichever is lower). ☐ The highest fundamental frequency of the EUT is above 30 GHz (measurement shall be made up to the fifth harmonic or 200 GHz, whichever is lower).
----------------	--

4.4 Transmitter characteristics (according to XC Tracer GmbH)

Mode FLARM

Method of frequency generation	☒ Crystal
Transmitter operating frequency range (OFR) The OFR is the total range of frequencies covered by one type, or by a family of equipment. It is noted that a family of equipment may be capable of covering a wider frequency range than the alignment frequency range of one type of equipment.	902.6 MHz to 927.4 MHz
Channel separation (if applicable)	0.400 MHz
Number of channels	63
Maximum rated output power	16.8 dBm (at transmitter temporary RF output connector)
Variable carrier output	☒ Transmitter carrier output is not variable. RF output: $P_{OUT} = 34.6 \text{ mW}$ ☐ Transmitter carrier output is variable. Max. RF output: $P_{OUT \text{ MAX}} = \dots \text{ mW}$ Min. RF output: $P_{OUT \text{ MIN}} = \dots \text{ mW}$ ☐ RF output continuously variable ☐ RF output stepped: 1 dB per step
Modulation	☐ Amplitude ☐ Frequency: Deviation kHz ☐ Phase ☐ Pulse Pulse repetition frequency Duty cycle ☒ Other FSK
	☒ Transmitter can be operated without modulation ☐ Transmitter can only be operated with modulation

Mode LoRa

Method of frequency generation	☒ Crystal
Transmitter operating frequency range (OFR) The OFR is the total range of frequencies covered by one type, or by a family of equipment. It is noted that a family of equipment may be capable of covering a wider frequency range than the alignment frequency range of one type of equipment.	903 MHz to 927 MHz
Channel separation (if applicable)	0.200 MHz
Number of channels	121
Maximum rated output power	16.76 dBm (at transmitter temporary RF output connector)
Variable carrier output	☒ Transmitter carrier output is not variable.
Modulation	☒ Other LoRa (500 kHz)
	☐ Transmitter can be operated without modulation ☒ Transmitter can only be operated with modulation

4.5 Receiver characteristics (according to XC Tracer GmbH)

Mode FLARM

Receiver operating frequency range	902.6 MHz to 927.4 MHz
Channel separation (if applicable)	0.400 MHz
Number of channels	63

Mode LoRa

Receiver operating frequency range	903 MHz to 927 MHz
Channel separation (if applicable)	0.200 MHz
Number of channels	121

4.6 Antenna specifications (according to XC Tracer GmbH)

The EUT uses an internal PCB antenna. It is specified in the XC-Tracer Maxx II Antenna report.

Antenna for FLARM and LoRa

Model No. of antenna: XC_Tracer_Maxx_R01_Antenna_2020-01-14

Type of antenna: PCB antenna soldered directly to the main PCB

Peak Gain of the antenna: 3.6 dBi

Frequency range: 866-930 MHz

The mounting of the antenna is fixed to the radio module and no other antenna should be used.

4.7 Ports

Port	Cable			Remark
	Max. length	Type	Screen	
USB	2 m ($\leq$ 3 m)	USB C	Yes	EUT not intended to transmit when USB cable is connected. EUT switches to charging mode when USB cable is connected

5. Test conditions

5.1 Climatic conditions, location and date

Location	Date	Temp.	Pressure	Rel. humidity
Eurofins Electric & Electronic Product Testing AG 1728 Rossens SWITZERLAND	2022-04-12 to 2022-09-21	See § 6		

5.2 Test facility and methodology

The test site is accepted by FCC:
 - Test Firm Registration Number: 683197
 - Designation Number: CH5001

Conducted and radiated measurements are performed according to the ANSI C63.4-2014 and C63.10-2013 procedures.

5.3 Attendant persons

Test Engineer(s):

Mr F. Wyler
 EMC Test Engineer

Other(s):

Name	Company
Mr Koni Schafroth	XC Tracer GmbH

5.4 Test configuration

See set-up drawings and pictures in relevant test paragraph

5.5 Operating conditions

Powered by Battery 3.7 VDC if not stated otherwise in § 6

Mode FLARM, Power setting 18 dBm

- Continuous hopping transmission of random data on sixtythree frequencies
- Normal operation: transmission of random data with hopping sequence
- Continuous reception on single frequency
- Continuous transmission of random data on one frequency, Duty cycle 11% (for measurement purposes only)

Mode LoRa, Power setting 18 dBm:

- Continuous reception on single frequency
- Continuous transmission of random data on one frequency, Duty cycle 17% (for measurement purposes only)

Normal Operation (according to XC Tracer GmbH)

- Usage of frequency band is software controlled to 1 %. Every second one FLARM package is transmitted with a duration of around 5 msec. Every few seconds one LoRa package is transmitted with a duration of 20-30 msec.

5.6 Auxiliary equipment

The following equipment is used for the monitoring of the EUT or is necessary for the EUT but is not part of the EUT

Product	Brand	Model No.	ID	Remark
AC – USB adaptor	Apple	A2164	Reference	100 – 240 V _{AC} input, 5 V _{DC} output (USB). Used for conducted tests in charging mode
AC – USB adaptor	Apple	W010A051	Reference Eurofins	100 – 240 V _{AC} input, 5 V _{DC} output (USB). Used for radiated tests in charging mode

AC – USB adaptor
used for conducted tests in charging mode

Marking on AC - USB adaptor

AC – USB adaptor
used for radiated tests in charging mode

Marking on AC - USB adaptor

6. Test results

6.1 Mode FLARM

6.1.1 Channel 20dB-bandwidth

Introduction: Channel-bandwidth measured at -20 dBc.

Test site: ☐ SAC10 ☐ open test site
☐ SAC3 ☒ laboratory

Meas. uncertainty: 9kHz – 3GHz: ± 1 dB
 3GHz – 6.7GHz: ± 2.1 dB
 6.7GHz – 13.2GHz: ± 2.6 dB
 13.2GHz – 19GHz: ± 2.8 dB
 19GHz – 26.5GHz: ± 3 dB

Method: Measurement on the temporary antenna connector

Limit: - - -

6.1.2 Carrier frequency separation

Introduction: Determination of the frequency separation of two adjacent channels.

Test site: ☐ SAC10 ☐ open test site
☐ SAC3 ☒ laboratory

Meas. uncertainty: $\pm 2.6 \mu\text{Hz/Hz}$

Method: Measurement of the frequency separation on the temporary antenna connector.

Requirement: Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

Test set-up:

Remarks: - - -

Test equipment:

Spectrum analyzer	☐ 88-14	☐ 94-24	☐ 02-06	☐ 03-45	☐ 05-39	☒ 18-01

6.1.4 Time of occupancy (dwell time)

Introduction: Average duration during which the system stays on one channel.

Test site: ☐ SAC10 ☐ open test site
☐ SAC3 ☒ laboratory

Meas. uncertainty: $\pm 2.6 \mu\text{s/s}$

Method: Measurement on the antenna connector or a test fixture.

Requirement: For frequency hopping systems operating in the 902–928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

Test set-up:

Modifications: ☒ None ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

Climatic conditions: Temperature: 23 °C Humidity: 40 % Pressure QFE: 939 hPa

Frequency (MHz)	Measured Dwell time (ms)	Average use ratio of one frequency in a 20 second period	Maximum occupied dwell time of each frequency* (ms)	Limit	Result
902.6	5.33	0.317	1.69	400 ms in 20 s period	Pass
915.0	5.28	0.317	1.67	400 ms in 20 s period	Pass
927.4	5.28	0.317	1.67	400 ms in 20 s period	Pass

*Note: One frequency is used per second (declared by manufacturer), so in average, each frequency is used (20 s / 63 channels) in a 20 second period (also see § 6.1.5)

Example of pulse duration at frequency 915 MHz

Place and date of test:
Operator:

Rossens, 2022-05-11
F. Wyler

6.1.5 Pseudorandom frequency hopping sequence and equal hopping frequency use Declared by manufacturer:

Pseudorandom frequency hopping sequence:

Describe how the hopping sequence is generated. Provide an example of the hopping sequence channels, to demonstrate that the sequence meets the requirement specified in the definition of an FHSS system, found in Section 2.1(c). Per the definition in Section 2.1(c), the hop set shall appear as random in the near term, shall appear as evenly distributed in the long term, and sequential hops shall be randomly distributed in both direction and magnitude of change.

The hopping sequence is generated from a pseudo-random source, based on the current GPS time. Two frequencies are used per second.

Equal hopping frequency use:

Describe how each individual EUT meets the requirement that each of its hopping channels is used equally on average (e.g., that each new transmission event begins on the next channel in the hopping sequence after the final channel used in the previous transmission event).

The figure shows the number of times a particular frequency was used over 10.000 s:

Since the frequency selection is pseudo-random based on the timestamp, and since every frequency slot is used for exactly one transmission, it is clear that on average you get uniform usage also.

6.1.6 Antenna gain & effective radiated power

- Introduction: The effective radiated power is the power radiated by the antenna of a transmitter in its direction of maximum gain under specified conditions of measurement. The antenna gain is the difference (in dB) of the radiated ERP power and the conducted power.
- Test site: ☒ SAC3 ☐ SAC10
- Distance: ☐ 1 m ☒ 3 m ☐ 10 m ☐ 30 m
- Position of EUT: 1.5 m (height of the equipment under test above floor)
- Meas. uncertainty: ± 3 dB ($f < 300$ MHz) / ± 3.3 dB ($f > 300$ MHz)
- Test method: The electromagnetic disturbance radiated by the equipment is measured using a spectrum analyzer and a wide band antenna. The ERP / EIRP values are determined replacing the EUT by a substitution antenna (dipole or other). The limits on the plots represent the equivalent field levels for the required power limits.
- Limit: Antenna gain 6 dBi (for a maximum conducted power of 1 W = 30 dBm). If antennas with directional gains exceeding 6 dBi are used, the maximum peak output power shall be reduced as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

Results of the test

Applicant: XC Tracer GmbH

EUT: XC Tracer Maxx II (ID: 2000C9)

Operating mode: TX, f = 902 / 915 / 928 MHz, modulated, power setting 18 dBm

Cables connected to the EUT: - - -

Remarks: RBW = 300 kHz, VBW 910 kHz; Peak detector

Modifications: ☒ None ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

Climatic conditions: Temperature: 24 °C Humidity: 29 % Pressure QFE: 919 hPa

f [MHz]	Measurement with EUT		Power at substitution ant.		Meas. with subst. ant.	Parameters of substitution ant.		Result			Polarisation
	U [dBuV]	preamp [dB]	P [dBm]	factor [dB]	U [dBuV]	gain [dB]	att. Cable [dB]	corr. [dB]	P ERP [dBm]	P ERP [W]	
902	87.3	0.0	10.0	-10	73.1	2.1	0	-70.96	16.34	43.05 mW	Vertical
902	92.1	0.0	10.0	-10	76.4	2.1	0	-74.34	17.76	59.70 mW	Horizontal
915	87.3	0.0	10.0	-10	72.8	2.1	0	-70.67	16.63	46.03 mW	Vertical
915	91.8	0.0	10.0	-10	75.9	2.1	0	-73.80	18.00	63.10 mW	Horizontal
928	84.3	0.0	10.0	-10	71.8	2.1	0	-69.67	14.63	29.04 mW	Vertical
928	90.5	0.0	10.0	-10	74.8	2.1	0	-72.67	17.83	60.67 mW	Horizontal

The antenna gain is the difference (in dB) of the radiated ERP power and the conducted power of § 6.1.7 :

frequency [MHz]	Conducted power [dBm]	Radiated power ERP [dBm]	Antenna gain [dBi]	Remarks
902	16.76	17.76	1.00	- - -
915	16.57	18.00	1.43	- - -
928	16.34	17.83	1.49	- - -

The measured antenna gain for radiated measurements is somewhat smaller than the declared antenna gain in chapter 4.6. However this is within the measurement error.

The device has an built in internal antenna, which can not be changed (Pass)

The antenna gain is specified in chapter 4.6 is 3.6 dBi < 6 dBi (Pass)

6.1.7 Maximum output power (conducted)

Test site: ☐ SAC10 ☐ open test site
☐ SAC3 ☒ laboratory

Meas. uncertainty: 9kHz – 3GHz: ± 1 dB
 3GHz – 6.7GHz: ± 2.1 dB
 6.7GHz – 13.2GHz: ± 2.6 dB
 13.2GHz – 19GHz: ± 2.8 dB
 19GHz – 26.5GHz: ± 3 dB

Test method: Measurement of the conducted power on the antenna connector or a test fixture.

Requirement: For frequency hopping systems operating in the 902-928 MHz band, the maximum peak conducted output power of the intentional radiator shall not exceed 1 watt (30 dBm) for systems employing at least 50 hopping channels.

Test set-up:

Remarks: - - -

6.1.10 Spurious emissions, transmit mode – radiated

6.1.10.1 9 kHz to 30 MHz

Test site: ☒ SAC3 ☐ SAC10Distance: ☒ 3 m ☐ 10 m ☐ 30 m

Position of EUT: 1 m (height of the equipment under test above floor)

Meas. Uncertainty: ± 2.8 dB

Test method: The magnetic disturbance radiated by the equipment under test is measured using a spectrum analyzer and a wide band magnetic antenna. The antenna is placed at 1 m height, first in the direction of the apparatus under test, then at 90° to the apparatus and if required also horizontally. If possible the turning table is operated through 360° during the measurement. The recording is carried out taking into account the maximum value of the disturbance appearing during the functioning of the apparatus under test. The peak values are recorded continuously on a graph. The values exceeding the limits are re-measured using a measuring receiver.

Modifications: ☒ None ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

Climatic conditions: Temperature: 24 °C Humidity: 29 % Pressure QFE: 919 hPa

Test set-up:

Remarks: Limit values expressed in dB μ V/m and transformed to a measuring distance of 10 m (factor used = 40 dB/decade) if necessary
e.g.: for f = 10 MHz the limit is 30 μ V/m at 30 m;

$$20 \log \left(\frac{30 \frac{\mu V}{m}}{1 \frac{\mu V}{m}} \right) + 40 \log \left(\frac{30 m}{3 m} \right) = 69.5 \frac{dB \mu V}{m} \text{ at } 3m$$

“Parallel” means measurement antenna axis towards EUT

Comment: None

Climatic conditions: Temperature: 23 °C Humidity: 30 % Pressure QFE: 932 hPa (2022-04-12)

Test set-up:

Remarks: - Limit values expressed in dB μ V/m and transformed to a measuring distance of 1m (factor used = 20 dB/decade) if necessary. E.g.: for f = 1 GHz the limit is 500 μ V/m at 3 m;

$$20 \log \left(\frac{500 \frac{\mu V}{m}}{1 \frac{\mu V}{m}} \right) + 20 \log \left(\frac{3m}{3m} \right) = 54 \frac{dB\mu V}{m} \text{ at } 3m$$

- Average measurements determined from the peak field strength after correcting for the worst-case duty cycle according to § 4.1.4.2.4 of ANSI C63.10:2013. Correction factor: $\delta(dB) = 20\log(\Delta) = 20 \log (20/500) = -27.96$ dB

Remarks:

- Limit values expressed in dB μ V/m and transformed to a measuring distance of 3 m (factor used = 20 dB/decade) if necessary
e.g.: for f = 40 MHz the limit is 100 μ V/m at 3 m;

$$20 \log \left(\frac{100 \frac{\mu V}{m}}{1 \frac{\mu V}{m}} \right) + 20 \log \left(\frac{3m}{3m} \right) = 40 \frac{dB\mu V}{m} \text{ at } 3m$$

6.2 Mode LoRa

6.2.1 Antenna requirement

Requirement: According to § 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the user of a standard antenna jack or electrical connector is prohibited. The structure and application of the EUT were analyzed to determine compliance with section §15.203 of the rules. §15.203 state that the subject device must meet the following criteria:

- a. Antenna must be permanently attached to the unit.
- b. Antenna must use a unique type of connector to attach to the EUT.

Unit must be professionally installed, and installer shall be responsible for verifying that the correct antenna is employed with the unit.

And according to FCC 47 CFR section 15.247 (b), if the transmitting antennas of directional gain greater than 6dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

Results of the test

The device has an built in internal antenna, which can not be changed (Pass)

The antenna gain is specified in chapter 4.6 is 3.6 dBi < 6 dBi (Pass)

Measurements with Peak detector and Trace Max Hold

frequency [MHz]	Temp [°C]	U [V]	P [dBm]	Limit [dBm]	Remarks	Pass Yes	Pass No
903	23	---	10.02	8	---	☒ *	☐
915	23	---	8.52	8	---	☒ *	☐
927	23	---	9.38	8	---	☒ *	☐

* Comment:

The LoRa transmission packet starts with an unmodulated chirp signal for recognition of the packet start. With Peak detector and Trace Max Hold, this results in a too height power spectral density for the carrier. Therefore the spectral density was measured with rms detector and Trace averaging, too show that the requirements is fulfilled.

6.2.7 Spurious emissions, transmit mode – radiated

6.2.7.1 9 kHz to 30 MHz

Test site: ☒ SAC3 ☐ SAC10Distance: ☒ 3 m ☐ 10 m ☐ 30 m

Position of EUT: 1 m (height of the equipment under test above floor)

Meas. Uncertainty: ± 2.8 dB

Test method: The magnetic disturbance radiated by the equipment under test is measured using a spectrum analyzer and a wide band magnetic antenna. The antenna is placed at 1 m height, first in the direction of the apparatus under test, then at 90° to the apparatus and if required also horizontally. If possible the turning table is operated through 360° during the measurement. The recording is carried out taking into account the maximum value of the disturbance appearing during the functioning of the apparatus under test. The peak values are recorded continuously on a graph. The values exceeding the limits are re-measured using a measuring receiver.

Modifications: ☒ None ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

Climatic conditions: Temperature: 25 °C Humidity: 46 % Pressure QFE: 938 hPa

Test set-up:

Remarks: Limit values expressed in dB μ V/m and transformed to a measuring distance of 10 m (factor used = 40 dB/decade) if necessary
e.g.: for f = 10 MHz the limit is 30 μ V/m at 30 m;

$$20 \log \left(\frac{30 \frac{\mu V}{m}}{1 \frac{\mu V}{m}} \right) + 40 \log \left(\frac{30 m}{3 m} \right) = 69.5 \frac{dB \mu V}{m} \text{ at } 3m$$

6.2.7.2 30 MHz to 1 GHz

Test site: ☐ SAC10 ☒ SAC3Distance: ☒ 3 m ☐ 10 m ☐ 30 m

Position of EUT: 1.5 m (height of the equipment under test above floor)

Meas. Uncertainty: ± 4.6 dB (30 – 300 MHz) / ± 3.7 dB (300 – 1000 MHz)

Test method: The electromagnetic disturbance radiated by the equipment is measured using a spectrum analyzer and a wide band antenna. The antenna is moved from 1 to 4 m in height successively with horizontal and vertical polarizations. The turning table is operated through 360° during the measurements. The recordings are carried out taking into account the maximum value of all the disturbances appearing while the apparatus is under test. The peak values are recorded continuously on the graph. The values exceeding a limit are re-measured manually using a receiver.

Modifications: ☒ None ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

Climatic conditions: Temperature: 26 °C Humidity: 45 % Pressure QFE: 934 hPa (2022-07-28)

Test set-up:

Remarks: - Limit values expressed in dBμV/m and transformed to a measuring distance of 3 m (factor used = 20 dB/decade) if necessary
e.g.: for f = 40 MHz the limit is 100 μV/m at 3 m;

$$20 \log \left(\frac{100 \frac{\mu V}{m}}{1 \frac{\mu V}{m}} \right) + 20 \log \left(\frac{3m}{3m} \right) = 40 \frac{dB\mu V}{m} \text{ at } 3m$$

6.2.7.3 1 GHz to 2.5 GHz (FCC / industry Canada)

Test site: ☒ SAC3 ☐ SAC10

Distance: ☐ 1 m ☒ 3 m ☐ 10 m ☐ 30 m

Position of EUT: 1.5 m (height of the equipment under test above floor)

Meas. Uncertainty: ± 4.7 dB

Test method: The electromagnetic disturbance radiated by the equipment is measured using a spectrum analyzer and a wide band antenna. The antenna is moved from 1 to 4 m in height successively with horizontal and vertical polarizations, and aimed at the source by tilting. The turning table is operated through 360° during the measurements. The recordings are carried out taking into account the maximum value (peak) of all the disturbances appearing while the apparatus is under test.

Modifications: ☒ None ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

Comment: Proto 1 has no modifications, Proto 4 with modifications Level 1

Climatic conditions: Temperature: 24 °C Humidity: 30 % Pressure QFE: 919 hPa (2022-04-22)

Test set-up:

Remarks:

- Limit values expressed in dB μ V/m and transformed to a measuring distance of 1m (factor used = 20 dB/decade) if necessary. E.g.: for f = 1 GHz the limit is 500 μ V/m at 3 m;

$$20 \log \left(\frac{500 \frac{\mu V}{m}}{1 \frac{\mu V}{m}} \right) + 20 \log \left(\frac{3m}{3m} \right) = 54 \frac{dB\mu V}{m} \text{ at } 3m$$
- Average measurements determined from the peak field strength after correcting for the worst-case duty cycle according to § 4.1.4.2.4 of ANSI C63.10:2013. Correction factor: $\delta(dB) = 20\log(\Delta) = 20 \log (20/500) = -27.96$ dB

6.2.7.4 2.5 GHz to 10 GHz (FCC / industry Canada)

Test site: ☒ SAC3 ☐ SAC10

Distance: ☐ 1 m ☒ 3 m ☐ 10 m ☐ 30 m

Position of EUT: 1.5 m (height of the equipment under test above floor)

Meas. Uncertainty: ± 4.7 dB

Test method: The electromagnetic disturbance radiated by the equipment is measured using a spectrum analyzer and a wide band antenna. The antenna is moved from 1 to 4 m in height successively with horizontal and vertical polarizations, and aimed at the source by tilting. The turning table is operated through 360° during the measurements. The recordings are carried out taking into account the maximum value (peak) of all the disturbances appearing while the apparatus is under test.

Modifications: ☒ None ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

Comment: Proto 1 has no modifications, Proto 4 with modifications Level 1

Climatic conditions: Temperature: 24 °C Humidity: 30 % Pressure QFE: 919 hPa (2022-04-22)

Test set-up:

Remarks: - Limit values expressed in dBμV/m and transformed to a measuring distance of 1m (factor used = 20 dB/decade) if necessary. E.g.: for f = 1 GHz the limit is 500 μV/m at 3 m;

$$20 \log \left(\frac{500 \frac{\mu V}{m}}{1 \frac{\mu V}{m}} \right) + 20 \log \left(\frac{3m}{3m} \right) = 54 \frac{dB\mu V}{m} \text{ at } 3m$$

- Average measurements determined from the peak field strength after correcting for the worst-case duty cycle according to § 4.1.4.2.4 of ANSI C63.10:2013. Correction factor: $\delta(dB) = 20\log(\Delta) = 20 \log (20/500) = -27.96$ dB

6.3 Conducted emission – Interference voltage

Test site: ☐ SAC10 ☐ shielded room
☒ SAC3 ☐ laboratory

Meas. Uncertainty: ± 3.6 dB

Measuring method: The conducted disturbance is measured using a spectrum analyzer and a line impedance substitution network (LISN). The measurement of the voltage against the earth is carried out successively. The peak values are recorded continuously on the graph. The values that exceed the limit are re-measured with a measuring receiver.

Modifications: ☒ None ☐ 1 ☐ 2

Climatic conditions: Temperature: 24 °C Humidity: 32 % Pressure QFE: 935 hPa

Test set-up:

Remarks: Tested in charging mode only because EUT is not intended to transmit when USB cable is connected

Test equipment:

6.4 Designation of emission

Standard: United States: 47 CFR "Code of Federal Regulations" – Telecommunication
☒ FCC Part 2, Subpart C: Emission: §2.201 and §2.202

Introduction: A system of designating emission, modulation and transmission characteristics shall be employed.

(a) Emissions are designated according to their classification and their necessary bandwidth.

(b) A minimum of three symbols are used to describe the basic characteristics of radio waves.

(c) Four symbols are used to describe the necessary bandwidth.

Modifications: ☒ None ☐ 1 ☐ 2 ☐ 3 ☐ 4 ☐ 5

Necessary bandwidth: For a given class of emission, the minimum value of the occupied bandwidth sufficient to ensure the transmission of information at the rate and with the quality required for the system employed, under specified conditions.

$B_n = 200 \text{ kHz}$ (occupied bandwidth)

Basic characteristics: FXD F : frequency modulation
 X : Cases not otherwise covered
 D : data transmission

Designation of emission: 200KFXD
