 Label

Independent Operation Modes

The basic operation modes are:

- Transceiver mode.

For further information refer to User Manual

Related Submittal(s) Grants

- This is a single application for certification of the Transceiver Module.

Remark

The test results in this test report are only relevant to the tested sample and does not involve any assessment in the production.

Test Set-up and Operation Mode

Principle of Configuration Selection

Emission: The equipment under test (EUT) was configured to measure its highest possible radiation level. The test modes were adapted accordingly in reference to the instructions for use.

Test Operation and Test Software

Test operation should refer to test methodology.

- During test, Channel & Power Controlling Software provided by the customer was used to control the operating channel as well as the output power level. The RF output power is fixed.

Special Accessories and Auxiliary Equipment

- Nil

Countermeasures to achieve EMC Compliance

- Nil

Test Methodology

Radiated Emission

The radiated emission measurements of the transmitter part were performed according to the procedures in ANSI C63.10-2013.

For measurement below 1GHz - the equipment under test (EUT) was placed at the middle of the 80 cm height turntable. For measurement above 1GHz - the EUT was placed at the middle of the 1.5 m height turntable and RF absorbing material was placed on ground plane between turntable and measuring antenna. During the testing, the EUT was operated standalone and arranged for maximum emissions. The EUT was tested in three orthogonal planes.

The investigation is performed with the EUT rotated 360 °, the antenna height scanned between 1m and 4m, and the antenna rotated to repeat the measurements for both the horizontal and vertical antenna polarizations. Repeat the measurement steps until the maximum emissions were obtained.

All radiated tests were performed at an antenna to EUT with 3 meters distance, unless stated otherwise in particular parts of this test report.

Field Strength Calculation

The field strength at 3 m was established by adding the meter reading of the spectrum analyzer to the factors associated with antenna correction factor, cable loss, preamplifiers and filter attenuation.

The equation is expressed as follow:

$$FS = R + AF + CF + FA - PA$$

Where FS = Field Strength in dBuV/m at 3 meters.
R = Reading of Spectrum Analyzer in dBuV.
AF = Antenna Factor in dB.
CF = Cable Attenuation Factor in dB.
FA = Filter Attenuation Factor in dB.
PA = Preamplifier Factor in dB.

FA and PA are only be used for the measuring frequency above 1 GHz.

Test Setup Diagram

Diagram of Measurement Configuration for Radiation Test

Note: Measurements above 1 GHz are done with a table height of 1.5m. In addition, there is RF absorbing material on the floor of the test site for above 1GHz measurement.

Measurement Uncertainty

The estimated combined standard uncertainty for power-line conducted emissions measurements is $\pm 2.42\text{dB}$.

The estimated combined standard uncertainty for radiated emissions measurements is $\pm 4.81\text{dB}$ (9kHz to 30MHz) and $\pm 4.62\text{dB}$ (30MHz to 200MHz) and $\pm 5.67\text{dB}$ (200MHz to 1000MHz) and is $\pm 5.07\text{dB}$ (1GHz to 8.2GHz) and $\pm 4.58\text{dB}$ (8.2GHz to 12.4GHz) and $\pm 4.78\text{dB}$ (12.4GHz to 18GHz)

The reported expanded uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor of $k=2$, which for the level of confidence is approximately 95%.

Results FCC Part 15 – Subpart C

Common to DTS & FHSS

FCC 15.203 – Antenna Requirement 1		Pass
FCC Requirement:	No antenna other than that furnished by the responsible party shall be used with the device	
Results :		
Antenna 1	a) Antenna type:	Internal PCB Antenna
	b) Manufacturer and model no:	N/A
	c) Peak Gain:	-3.50 dBi at 928MHz
Verdict:	Pass	

FCC 15.204 – Antenna Requirement 2		Pass
An intentional radiator may be operated only with the antenna with which it is authorized. If an antenna is marketed with the intentional radiator, it shall be of a type which is authorized with the intentional radiator. Only one authorized antennas can be used.		
Verdict:	Pass

Remarks: Pre-scan has been conducted to determine the worst-case mode from all possible combinations between available modulations and data rate. The radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150kHz to 30MHz does not exceed the limits. For test Results plots refer to Appendix 1, page 2.						

FCC 15.247 (a) – Receiver Input Bandwidth	Pass
FCC Requirement: The associated receiver(s) complies with the requirement that its input bandwidth matches the bandwidth of the transmitted signal.	
Refer to LoRa Specification	

Digital Modulation System (DTS)

FCC 15.247 (a)(2) – 6dB Bandwidth Measurement		Pass
FCC Requirement: Systems using digital modulation techniques may operate in the 902 – 928 MHz, 2400 – 2483.5 MHz, and 5725 – 5850 MHz bands. The minimum 6dB bandwidth shall be at least 500kHz.		
Test Specification : ANSI C63.10 – 2013 Test date : 06.10.2023 Mode of operation : Tx mode Supply voltage : USB-C 5.0 VDC Temperature : 23°C Humidity : 51%		
Results: For test protocols please refer to Appendix 1		
Channel frequency (MHz)	6dB bandwidth (kHz)	Limit (kHz)
920.8	627.9	≥ 500

FCC 15.247 (b)(3) – Maximum conducted output power		Pass	
FCC Requirement: For systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850MHz bands: 1 Watt (30dBm)			
Test Specification : ANSI C63.10 – 2013 Test date : 06.10.2023 Mode of operation : Tx mode Supply voltage : USB-C 5.0 VDC Temperature : 23°C Humidity : 51%			
Results: For test protocols please refer to Appendix 1			
Frequency (MHz)	Maximum peak output power (dBm) (mW)	Limit (dBm W)	Verdict
920.8	12.41 17.42	30.0 1	Pass

FCC 15.247 (e) – Power Spectral Density		Pass	
FCC Requirement: For systems using digital modulation, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.			
Test Specification : ANSI C63.10 – 2013 Test date : 06.10.2023 Mode of operation : Tx mode Supply voltage : USB-C 5.0 VDC Temperature : 23°C Humidity : 51%			
Results: For test protocols please refer to Appendix 1.			
Frequency (MHz)	Maximum Power Spectral Density (dBm)	Limit (dBm)	Verdict
920.8	7.20	8.0	Pass

FCC 15.247 (d) – Spurious Conducted Emissions						Pass
Test Specification : ANSI C63.10 – 2013 Test date : 06.10.2023 Mode of operation : Tx mode Supply voltage : USB-C 5.0 VDC Temperature : 25°C Humidity : 56%						
FCC Requirement: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement.						
Results: Pre-scan has been conducted to determine the worst-case mode from all possible combinations between available modulations and data rate. Only the worst cases is shown below. For test protocols refer to Appendix 1						
Operating frequency (MHz)	Spurious frequency (MHz)	Spurious Level (dBm)	Reference value (dBm)	Limit (dBm)	Margin (dB)	Verdict
920.8	No peak found	--	--	--	--	Pass

FCC 15.205 – Radiated Emissions in Restricted Frequency Bands			Pass
Test Specification : ANSI C63.10 – 2013 Test date : 06.07.2023 ~18.09.2023 Mode of operation : Tx mode Frequency range : 9kHz – 10GHz Supply voltage : Battery 3.7 VDC; USB-C 5.0 VDC Temperature : 25.2°C Humidity : 50%			
FCC Requirement: In any 100kHz bandwidth outside the frequency band at least 20dB below the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands must also comply with the radiated emission general limits.			
Results: Pre-scan has been conducted to determine the worst-case mode from all possible combinations between available modulations and data rate. All three transmit frequency modes comply with the field strength within the restricted bands. There is no spurious found below 30MHz.

FCC 15.247 (a)(1) – Carrier Frequency Separation		Pass
Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25kHz or the 20dB bandwidth of the hopping channel, whichever is greater.		
Test Specification : ANSI C63.10 – 2013 Test date : 28.09.2023 Mode of operation : Tx mode (hopping on) Port of testing : Temporary antenna port Supply voltage : USB-C 5.0 VDC Temperature : 22°C Humidity : 55%		
Results: Pre-scan has been conducted to determine the worst-case mode from all possible combinations between available modulations and packet types. For test Results plots refer to Appendix 1.		
Channel Separation (kHz)	Limit (kHz)	Verdict
400	206	Pass

FCC 15.247 (a)(1)(iii) – Number of hopping channels		Pass
For frequency hopping systems operating in the 902-928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall use at least 50 hopping frequencies; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies.		
Test Specification : ANSI C63.10 – 2013 Test date : 28.09.2023 Mode of operation : Tx mode (hopping on) Port of testing : Temporary antenna port Supply voltage : USB-C 5.0 VDC Temperature : 22°C Humidity : 55%		
Results: For test Results plots refer to Appendix 1.		
No. of hopping channels	Limit	Verdict
63	50	Pass

FCC 15.247 (a)(1)(iii) – Time of Occupancy (Dwell Time)		Pass
For frequency hopping systems operating in the 902-928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period.		
Test Specification : ANSI C63.10 – 2013 Test date : 28.09.2023 Mode of operation : Tx mode (hopping on) Port of testing : Temporary antenna port Supply voltage : USB-C 5.0 VDC Temperature : 22°C Humidity : 55%		
902.6 MHz		
Results: Time period calculation = 20s Dwell time = $1 \times 5.21 \times 10^{-3} = 0.00521 \text{ s}$ $\leq 0.4 \text{ s}$ For test protocols please refer to Appendix 1.		
Verdict: Pass		
914.6 MHz		
Results: Time period calculation = 20s Dwell time = $1 \times 5.2 \times 10^{-3} = 0.0052 \text{ s}$ $\leq 0.4 \text{ s}$ For test protocols please refer to Appendix 1.		
Verdict: Pass		

927.4 MHz	
Results:	Time period calculation = 20s Dwell time = $1 \times 5.2 \times 10^{-3} = 0.0052 \text{ s}$ $\leq 0.4 \text{ s}$ For test protocols please refer to Appendix 1.
Verdict:	Pass

FCC 15.247 (a) – Hopping Sequence	Pass
The system radio frequency (RF) bandwidth is equal to the channel bandwidth multiplied by the number of channels in the hop set. The hop set shall be such that the near-term distribution of frequencies appears random, with sequential hops randomly distributed in both direction and magnitude of change in the hop set, while the long-term distribution appears evenly distributed.	
Refer to LoRa Specification	

FCC 15.247 (a) – Equal Hopping Frequency Use	Pass
Each of the transmitter's hopping channels is used equally on average. The system radio frequency (RF) bandwidth is equal to the channel bandwidth multiplied by the number of channels in the hop set. The hop set shall be such that the near-term distribution of frequencies appears random, with sequential hops randomly distributed in both direction and magnitude of change in the hop set, while the long-term distribution appears evenly distributed.	
Refer to LoRa Specification	

FCC 15.247 (a) – Receiver Input Bandwidth	Pass
The associated receiver(s) complies with the requirement that its input bandwidth matches the bandwidth of the transmitted signal.	
Refer to LoRa Specification	

FCC 15.247 (a) – Receiver Hopping Capability	Pass
The associated receiver has the ability to shift frequencies in synchronisation with the transmitted signals.	
Refer to LoRa Specification	

FCC 15.247 (b)(1) – Peak Output Power				Pass
Test Specification : ANSI C63.10 – 2013 Test date : 28.09.2023 Mode of operation : Tx mode Port of testing : Temporary antenna port Supply voltage : USB-C 5.0 VDC Temperature : 23°C Humidity : 50%				
For frequency hopping systems operating in the 902-928 MHz band: 1 watt for systems employing at least 50 hopping channels; 0.25 watts for systems employing less than 50 hopping channels, but at least 25 hopping channels.				
For test protocols please refer to Appendix 1.				
Frequency (MHz)	Cable loss (dB)	Maximum peak output power (dBm) (mW)	Limit (dBm W)	Verdict
902.6	0.5	13.21 20.94	30.0 1	Pass
914.6	0.5	12.82 19.14	30.0 1	Pass
927.4	0.5	12.78 18.97	30.0 1	Pass

FCC 15.247 (d) – Spurious Conducted Emissions				Pass		
Test Specification : ANSI C63.10 – 2013 Test date : 28.09.2023 Mode of operation : Tx mode Supply voltage : USB-C 5.0 VDC Temperature : 25°C Humidity : 56%						
FCC Requirement: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement.						
Results:		Pre-scan has been conducted to determine the worst-case mode from all possible combinations between available modulations and data rate. Only the worst cases is shown below. For test protocols refer to Appendix 1				
Operating frequency (MHz)	Spurious frequency (MHz)	Spurious Level (dBm)	Reference value (dBm)	Limit (dBm)	Margin (dB)	Verdict
902.6	No peak found	--	--	--	--	Pass
914.6	No peak found	--	--	--	--	Pass
927.4	No peak found	--	--	--	--	Pass

FCC 15.205 – Radiated Emissions in Restricted Frequency Bands			Pass
Test Specification : ANSI C63.10 – 2013 Test date : 06.07.2023 ~18.09.2023 Mode of operation : Tx mode Frequency range : 9kHz – 10GHz Supply voltage : Battery 3.7 VDC; USB-C 5.0 VDC Temperature : 25.2°C Humidity : 50%			
FCC Requirement: In any 100kHz bandwidth outside the frequency band at least 20dB below the highest level of the desired power. In addition, radiated emissions which fall in the restricted bands must also comply with the radiated emission general limits.			
Results: Pre-scan has been conducted to determine the worst-case mode from all possible combinations between available modulations and data rate. All three transmit frequency modes comply with the field strength within the restricted bands. There is no spurious found below 30MHz.

RF Exposure Information

FCC_ID : 2AVOQ03

Time-averaged maximum conducted output power:

Frequency (MHz)	Maximum output power (dBm)	Pulse duration (ms)	Period (ms)	10 log (1 / D) (dB)	Time-averaged maximum conducted output power (dBm) / (mW)
920.8	12.41	18.0	45.0	3.98	8.43 / 6.96
902.6	13.21	5.5	38.1	8.41	4.80 / 3.02
914.6	12.82	5.5	39.0	8.51	4.31 / 2.68
927.4	12.78	5.5	39.0	8.51	4.27 / 2.67

Note:

- The maximum conducted output power was taken from table of Subclause "FCC 15.247(b)(1) – Peak Output Power"
- Time-averaged maximum conducted output power is calculated by subtracting [10 log (1 / D)] dB from maximum output power, where D is duty cycle, 1 / D = period / pulse duration

For FCC

According to KDB 447498 D01:

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at *test separation distances* ≤5 mm are determined by:

$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot [\sqrt{f(\text{GHz})}] \leq 3.0$ for 1-g SAR and ≤7.5 for 10-g extremity SAR, where

- f(GHz) is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison
- 3.0 and 7.5 are referred to as the numeric thresholds in the step 2 below

Result:

$$(6.96/5) \cdot \sqrt{0.9208} = 1.336 < 3.0$$

$$(3.02/5) \cdot \sqrt{0.9026} = 0.574 < 3.0$$

$$(2.68/5) \cdot \sqrt{0.9146} = 0.513 < 3.0$$

$$(2.67/5) \cdot \sqrt{0.9274} = 0.514 < 3.0$$

Conclusion:

No SAR is required.
