NOTICE: (1) This Report must not be used to claim product endorsement, by NVLAP, NIST, the FCC or any other Agency. This report also does not warrant certification by NVLAP or NIST. (2) This report shall not be reproduced except in full, without the written approval of Professional Testing (EMI), Inc. (3) The significance of this report is dependent on the representative character of the test sample submitted for evaluation and the results apply only in reference to the sample tested. The manufacturer must continuously implement the changes shown herein to attain and maintain the required degree of compliance.

Certificate of Compliance

FCC MRA Designation Number: US5270

NVLAP Accreditation Number: 200062-0

Applicant	Device & Test Identification
Advanced TeleSensors, Inc. 5114 Balcones Woods Dr. Suite 307-472 Austin, TX 78759 Certificate Date: 11 Apr 2022	FCC ID: 2AXL8-ATX2410V4P1 Model(s): ATX2410, ATX2410-EQ, ATX2410-GW Laboratory Project ID: 22760-15

The EUT(s) listed above were tested utilizing the following documents and found to be in compliance with the required criteria.

Standard	Reference	Detail
FCC 47 CFR Part 15 C	15.249(a), 15.209, 15.205, 15.212(a)(1), 15.207	Radiated Power Bandwidth Spurious Emissions Mains Conducted Emissions

I, Larry Finn, for Professional Testing (EMI), Inc., being familiar with the above requirements and test procedures have reviewed the test setup, measured data, and this report. I believe them to be true and accurate.

Larry Finn
Chief Technical Officer

This report has been reviewed and accepted by the Applicant. The undersigned is responsible for ensuring that this device will continue to comply with the requirements listed above.

Representative of Applicant

1.0 Introduction

1.1 Scope

This report describes the extent to which the equipment under test (EUT) conformed to the intentional radiator requirements of the United States.

Professional Testing (EMI), Inc., (PTI) follows the guidelines of National Institute of Standards and Technology (NIST) for all uncertainty calculations, estimates, and expressions thereof for electromagnetic compatibility testing.

This report is intended to support a Class II Permissive Change for the ATX2410 (Hardware revision of the ATX-2410 device). The changes made from the previously approved device are:

- 1) PCB antenna traces moved slightly on PCB
- 2) HTS, ACCL, IR Sens, and DAC components depopulated from PCB

Spurious emissions and fundamental field strength were measured. All other parameters were not degraded as a result of these changes. Original bandwidth and conducted emissions test data included for completeness.

1.2 EUT Description

Table 1.2.1: EUT Essential Information	
Manufacturer & Model	Description
Advanced TeleSensors, Inc ATX2410	Non-contact vital signs monitor.

This device also contains a pre-certified WiFi module (FCC ID: O7P-362), which has been considered for RF Exposure.

1.3 EUT Operation

The EUT was exercised in a manner consistent with normal operations.

1.4 Modifications to Equipment

No modifications were made to the EUT during the performance of the test program.

1.5 Test Site

Measurements were made at the PTI semi-anechoic facility designated Site 45 (FCC 776781, IC 3036B-1) in Austin, Texas. The site is registered with the FCC under Section 2.948 and Industry Canada per RSS-GEN, and is subsequently confirmed by laboratory accreditation (NVLAP). The test site is located at 11400 Burnet Road, Austin, Texas 78758, while the main office is located at 1601 North A.W. Grimes Boulevard, Suite B, Round Rock, Texas, 78665. CAB Identifier: US 0123.

1.6 Measurement Correction Methods

Table 1.6 1 Measurement Corrections	
Parameter	From Sums Of
Radiated Field Strength	Raw Measured Level + Antenna Factor + Cable Losses – Amplifier Gain
Conducted Antenna Port	Raw Measured Level + Attenuator Factor + Cable Losses
Conducted Mains Port	Raw Measured Level + LISN Factor + Cable/Filter/Limiter Losses
Additionally, measurement distance extrapolation factors (such as 1/d above 30 MHz) are applied and documented where used.	

1.7 Applicable Documents

Table 1.7.1: Applicable Documents	
Document	Title
47 CFR	Part 15 – Radio Frequency Devices Subpart C -Intentional Radiators
ANSI C63.10 2013	ANSI C63.10-2013 American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices
ANSI C63.4 2014	American National Standard for Methods of Measurement of Radio-Noise Emissions from Low Voltage Electrical and Electronic Equipment

2.0 Fundamental Power, Clause: 15.249(a)

2.1 Test Procedure

Power is measured using radiated means and without modulation. Measurements made on Apr 8, 2022.

2.2 Test Criteria

Parameter		
Average Detection		
Fundamental frequency	Field strength of fundamental (millivolts/meter)	Field strength of harmonics (microvolts/meter)
902-928 MHz	50	500
2400-2483.5 MHz	50	500
5725-5875 MHz	50	500
24.0-24.25 GHz	250	2500
24 GHz Fundamental Power Limit Restated as dBμV/m: 108 dB μ V/m at 3 meters		

2.3 Test Results

Table 2.3.1: Field Strength of Fundamental; 1 Meter Measurement Distance Corrected to 3 meters					
Frequency GHz	Antenna Polarity	Corrected Level* (Measured Peak Level) dB μ V/m	Duty Cycle Averaging Factor dB	Calculated Average Level dB μ V/m	Margin dB
24.13	V	98.77	0	98.77	-9.23
24.13	H	86.19	0	94.7	-21.81

*Resolution bandwidth 1 MHz, video bandwidth 3 MHz, using peak detection.

The EUT satisfies the criteria.

Power, Vertical Polarity

Power, Horizontal Polarity

3.0 Occupied Bandwidth, Clause: 2.1049

3.1 Test Procedure

Bandwidth is measured by relative radiated means. Bandwidth measurements taken on 9/16/2020 (for original submission).

3.2 Test Criteria

Parameter
Bandwidth, 99%

3.3 Test Results

The bandwidth measurement is used for general reporting for agency application and serves to confirm the emission is confined to the designated band.

The EUT satisfied the requirements.

Note that this is an unmodulated Doppler device. Apparent bandwidth is largely due to the resolution bandwidth of the measuring instrument.

Table 3.3.1 Bandwidth 99%, Measure and Report
Measured BW (kHz)
65.8

4.0 Radiated Spurious Emissions, Transmit Mode, Clause: 15.249(a)

4.1 Test Procedure

The EUT was placed on a non-conductive table above a ground plane. The EUT was centered on a rotating turntable. Measurements below 1 GHz were taken at a test distance of 10 meters from the measurement antenna and a height of 80cm above the ground plane. Above 1 GHz the measurement distance was 3 meters or less as needed to overcome path loss and inherent equipment noise and a height of 1.5m above the ground plane.

Spurious emissions below 1 GHz were measured with quasi-peak detection with a resolution bandwidth of 120 kHz. Above 1 GHz peak measurements were taken and average measured where appropriate and 1 MHz resolution bandwidth. Testing conducted on 9/17/2021, 9/19/2021, and 3/23/2022.

4.2 Test Criteria

Parameter		
Average or Peak Detection, Limits for 15.249(a) and RSS-210 B.10:		
Fundamental frequency	Field strength of fundamental (millivolts/meter)	Field strength of harmonics (microvolts/meter)
902-928 MHz	50	500
2400-2483.5 MHz	50	500
5725-5875 MHz	50	500
24.0-24.25 GHz	250	2500
Non-harmonic emission limits: -50 dBc or general emission limits.		

4.3 Test Results

The EUT is a Doppler device, it must transmit to be able to receive. The EUT satisfied the criteria.

Above 26.5 GHz, external harmonic mixers are used. The factors for the mixers are included in the analyzer measurement. The horn is directly attached wave-guide to the harmonic mixer to eliminate any additional loss. The final measurement requires addition of the standard gain octave horn antenna factor (AF).

4.3.1 Up to 1 GHz

Vertical Polarization

Frequency (MHz)	EUT Direction (Degrees)	Antenna Height (cm)	Quasi-peak Reading (dBμV)	Quasi-peak Limit (dBμV)	Quasi-peak Margin (dB)	Quasi-peak Results

4.3.5 Up to 50 GHz

Vertical Polarization

No measurable signals observed between 40-50GHz.

Horizontal Polarization

No measurable signals observed between 40-50GHz.

4.3.6 Up to 75 GHz

Vertical Polarization

No measurable signals observed between 50-75GHz.

Horizontal Polarization

No measurable signals observed between 50-75GHz.

4.3.7 Up to 110 GHz

Vertical Polarization

No measurable signals observed between 75-110GHz.

Horizontal Polarization

No measurable signals observed between 75-110GHz.

5.0 Antenna Construction Requirements, Clause: 15.203

5.1 Procedure

A direct examination of the antenna construction is performed and compared to rule criteria that prevent wireless device antennas from being modified by end users.

5.2 Criteria

Parameter
An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. This requirement does not apply to carrier current devices or to devices operated under the provisions of §§ 15.211 , 15.213, 15.217, 15.219, 15.221, or § 15.236 . Further, this requirement does not apply to intentional radiators that must be professionally installed, such as perimeter protection systems and some field disturbance sensors, or to other intentional radiators which, in accordance with § 15.31(d) , must be measured at the installation site. However, the installer shall be responsible for ensuring that the proper antenna is employed so that the limits in this part are not exceeded.

5.3 Results

Table 5.3.1: Construction Results		
Criteria	Evaluation	Pass/Fail
Antenna must not be easily substituted by user.	The antenna is a permanent integral antenna (a printed circuit patch array).	Pass
Antenna must use a unique type of connector to attach to the EUT.	There is no antenna connector.	Pass

The EUT and antenna satisfied the requirements.

6.0 Mains Conducted Emissions, Clause: 15.207

6.1 Procedure

A direct examination of the antenna construction is performed and compared to rule criteria that prevent wireless device antennas from being modified by end users. Conducted emission measurements made on 9/25/2020 for the original submission.

6.2 Criteria

Parameter		
Frequency of emission (MHz)	Conducted limit (dBμV)	
	Quasi-peak	Average
0.15-0.5	66 to 56*	56 to 46*
0.5-5	56	46
5-30	60	50

6.3 Results

The EUT satisfied the requirements.

8.0 Measurement Bandwidths

Radiated Emissions Spectrum Analyzer Bandwidth and Measurement Time - Peak Scan				
Frequency Band Start (MHz)	Frequency Band Stop (MHz)	6 dB Bandwidth (kHz)	Number of Ranges Used	Measurement Time per Range
0.009	0.15	0.3	2	Multiple Sweeps
0.15	30	9	6	Multiple Sweeps
30	1000	120	2	Multiple 800 mS Sweeps
1000	6000	1000	2	Multiple Sweeps
6000	18000	1000	2	Multiple Sweeps
18000	100000	1000	2	Multiple Sweeps
*Notes: 1. The settings above are specifically calculated for the E4440A series of spectrum analyzers, which have 8,000 data points per range. 2. The measurement receiver resolution bandwidth setting was 300 Hz for quasi-peak measurements from 9-150 kHz. 3. The measurement receiver resolution bandwidth setting was 9 kHz for quasi-peak measurements from 0.15-30 MHz. 4. The measurement receiver resolution bandwidth setting was 120 kHz for quasi-peak measurements from 30-1000 MHz. 5. The measurement receiver resolution bandwidth setting was 1 MHz for average measurements from 1-18 GHz.				

Appendix: Policy, Rationale, and Evaluation of EMC Measurement Uncertainty

All uncertainty calculations, estimates and expressions thereof shall be in accordance with NIST policy. Since PTI operates in accordance with NIST (NVLAP) Handbook 150-11: 2007, all instrumentation having an effect on the accuracy or validity of tests shall be periodically calibrated or verified traceable to national standards by a competent calibration laboratory. The certificates of calibration or verification on this instrumentation shall include estimates of uncertainty as required by NIST Handbook 150-11.

1. Rationale and Summary of Expanded Uncertainty.

Each piece of instrumentation at PTI that is used in making measurements for determining conformance to a standard (or limit), shall be assessed to evaluate its contribution to the overall uncertainty of the measurement in which it is used. The assessment of each item will be based on either a type A evaluation or a type B evaluation. Most of the evaluations will be type B, since they will be based on the manufacturer's statements or specifications of the calibration tolerances, or uncertainty will be stated along with a brief rationale for the type of evaluation and the resulting stated uncertainties.

The individual uncertainties included in the combined standard uncertainty for a specific test result will depend on the configuration in which the item of instrumentation is used. The combination will always be based on the law of propagation of uncertainty. Any systematic effects will be accommodated by including their uncertainties, in the calculation of the combined standard uncertainty; except that if the direction and amount of the systematic effect cannot be determined and separated from its uncertainty, the whole effect will be treated as uncertainty and combined along with the other elements of the test setup.

Type A evaluations of standard uncertainty will usually be based on calculating the standard deviation of the mean of a series of independent observations, but may be based on a least-squares curve fit or the analysis of variance for unusual situations. Type B evaluations of standard uncertainty will usually be based on manufacturer's specifications, data provided in calibration reports, and experience. The type of probability distribution used (normal, rectangular, a priori, or u-shaped) will be stated for each Type B evaluation.

In the evaluation of the uncertainty of each type of measurement, the uncertainty caused by the operator will be estimated. One notable operator contribution to measurement uncertainty is the manipulation of cables to maximize the measured values of radiated emissions. The operator contribution to measurement uncertainty is evaluated by having several operators independently repeat the same test. This results in a Type A evaluation of operator-contributed measurement uncertainty.

A summary of the expanded uncertainties of PTI measurements is shown as Table 1. These are the worst-case uncertainties considering all operative influence factors.

Table 1: Summary of Measurement Uncertainties for Site 45

Type of Measurement	Frequency Range	Meas. Dist.	Expanded Uncertainty U, dB (k=2)
Mains Conducted Emissions	150 kHz to 30 MHz	N/A	2.9
Telecom Conducted Emissions	150 kHz to 30 MHz	N/A	2.8
Radiated Emissions	30 to 1,000 MHz	10 m	4.8
	1 to 18 GHz	3 m	5.7
