- 1) Not in the scope of evaluation. The EUT contains FCC certified modules. Only radiated spurious emissions including simultaneous transmissions was performed per FCC KDB 996369 D04 Module Integration Guide v02.

1.1 Modifications Required to Compliance

Some spurious emissions which had exceeded the average limit were an intermodulation of the LoRA (908MHz) and Zigbee (2.44GHz) radios. Removing the external 2.4GHz WiFi antenna improved this issue. Zigbee also has a low duty cycle. The client provided internal patch WiFi antennas to replace the hard-dome external WiFi antenna. Manufacturer also provided a technical document for the lower Zigbee duty cycle. Refer to appendix A for the duty cycle correction document.

The patch antenna part number was Pulse W3918B0050.

2 General Information

2.1 Client Information

Name: Airgo Systems, LLC.
Address: 8232 SW 23rd Place
City, State, Zip, Country: Oklahoma City, OK 73128, USA

2.2 Test Laboratory

Name: SGS North America, Inc.
Address: 620 Old Peachtree Road NW, Suite 100
City, State, Zip, Country: Suwanee, GA 30024, USA

Accrediting Body: A2LA
Type of lab: Testing Laboratory
Certificate Number: 3212.01
Designation Number: US1126
CAB Identifier: US0186

2.3 General Information of EUT

Type of Product: Large Vehicle Monitoring Telematics
Model Number: Drov-ABO
Serial Number: FCC 9083 (on label), 2017100031 (date code on pcb)
HW Version: 4.0
Firmware Version: Not provided
IMEI Number: 866258044356480

Contains FCC ID: 2AYTU-EG91-NA-ABO (cell)
2AKNO-VOLJN5179M16 (Zigbee) / VPYLB1YM (WLAN) /
SH6MDBT50Q (BLE) / 2ADWC-S76S (LoRA)

LTE Frequency Range Tested: 1850 – 1910 MHz (LTE Band 2)
699 – 716 MHz (LTE Band 12)

Simultaneous Radiators: LoRA – 908MHz
Zigbee – 2440MHz
802.11n – 2412MHz, 5825MHz (not at same time)
Bluetooth Low Energy – 2402MHz

Antenna Type/Gain*: Taoglas Patch / LTE Band 2 (6 dBi), LTE Band 12 (3.5 dBi)

Rated Voltage: 12 VDC

Test Voltage: 12 VDC

Sample Received Date: 11 June 2022

Dates of testing: 30 June – 25 August 2022; 27 January 2023 & 27 March 2023

Note: Antenna gain was not measured at SGS. Gain was referenced from antenna datasheet.*

2.4 *Operating Modes and Conditions*

The cellular operation of the EUT was exercised by connecting a CMW 500 Radio Communication Tester to the device. The CMW was used to control signaling and channel during testing.

The EUT was programmed to turn on all other radios simultaneously on fixed channels. The cellular radio was configured to operate on LTE Band 2 and then LTE Band 12 to evaluate the potential for intermodulation products with the other radios.

The Wi-Fi module would only transmit on 2.4GHz or 5GHz; results for both were captured in the test data section. Below 1GHz, there was no marked difference between the 2.4 and 5GHz operations. Only worst-case is reported.

Spurious emissions from unlicensed radios were compared to the FCC 15.209 average limit of 54dBuV/m at a 3m distance, which converts to an EIRP of -41.2dBm.

3 Radiated Spurious Emissions

3.1 Test Result

Test Description	Specification	Test Result
Transmitter Spurious Emissions	ANSI C63.10; ANSI C63.26	Compliant

3.2 Test Method

The levels of the carrier and the various conducted spurious and harmonics frequencies are measured by means of a calibrated spectrum analyzer. The spectrum is scanned from the lowest frequency generated in the equipment up to a frequency including its 10th harmonic. On any frequency outside a licensee's frequency block, the power of any emission shall be attenuated below the transmitter power (P) by at least $43 + 10 \log (P)$ dB.

A radio link was established between EUT and Radio Communications Tester. The output power of the EUT was set to maximum value by using the maximum power setting on the Radio Communications Tester.

Manufacturer provided a Duty Cycle Correction Factor (DCCF) for the Zigbee radio, which was included in the tabulated data of the after modifications test results. Both WLAN bands showed same Zigbee emissions, therefore only 2.4GHz WLAN with all radios was checked after modifications. Refer to Appendix A.

Initial measurements were performed at the low, middle and high channels of each band. Re-testing was performed at the middle channel of the worst-case band.

Spurious emissions from unlicensed radios were compared to FCC 15.209 limit: 54dBuV/m (-41.2dBm).

3.3 Test Site

10m Absorber Lined Shielded Enclosure (ALSE), Suwanee, GA
3m Absorber Lined Shielded Enclosure (ALSE), Suwanee, GA

Jun – Aug 2022	30-1000MHz	Above 1GHz
Environmental Conditions		
Temperature:	24.4 °C	23.9 °C
Relative Humidity:	59.6 %	57.2 %
Atmospheric Pressure:	98.94 kPa	98.02 kPa
March 27 2023	Above 1GHz	
Environmental Conditions		
Temperature:	24.8 °C	
Relative Humidity:	43.4 %	
Atmospheric Pressure:	97.6 kPa

12048.12	41.4	H	59.0	197.0	38.9	5.3	41.6	43.9	0.0	43.9	54.0	-10.1
Final Avg = Raw Avg + AF + Loss - Amp												
Tabular Data = Final Avg + DCCF												
Margin = Tabular Data - Limit												

7318MHz is third harmonic of Zigbee, therefore DCCF was used in above tabulation.

Peak

Frequency MHz	Raw Pk dBuV	Polarity (V/H)	Azimuth (degrees)	Height (cm)	AF (dB/m)	Loss (dB)	Amp (dB)	Final Pk dBuV/m	Limit dBuV/m	Margin dB
3753.16	63.0	H	211.0	100.0	33.4	2.7	42.0	57.2	74.0	-16.8
4281.00	56.5	H	110.0	212.0	33.5	2.8	42.0	50.8	74.0	-23.2
4803.64	54.7	H	313.0	231.0	34.6	2.9	42.1	50.1	74.0	-23.9
7318.60	64.3	H	24.0	189.0	35.8	4.0	42.0	62.1	74.0	-11.9
12048.12	52.2	H	59.0	197.0	38.9	5.3	41.6	54.7	74.0	-19.3
Final Pk = Raw Pk + AF + Loss - Amp										
Margin = Final Pk - Limit										

Note: 2.4GHz WLAN with all radios was worse case when compared to 5GHz WLAN.
Also, none of the failures before modification with LTE Band 12 transmitting were due to Band 12.

1	Updated with modifications for compliance results	03 April 2023

Appendix A

Zigbee DCCF use-case scenarios and calculations

Zigbee Use case scenarios:

Scenario 1: Sensor Data Acquisition

a. Description:

The AirBoxOne receives the temperature sensor data over Zigbee every 5 minutes and the AirBoxOne replies with an Ack signal. This is the normal and most common scenario.

b. Captured Waveforms:

During 100mSec Window:

No of Signals = 2

S1 = 1.584-(-0.367) = 1.951mSec

S2 = 59.762-57.533 = 2.229mSec

Total On Time during 100mSec : 1.951+2.229 = 4.18mSec

c. Calculations:

Total On Time: 4.18 mSec

DCCF (Duty Cycle Correction Factor): $20 \cdot \log(4.18/100) = -27.5764\text{dB}$

Scenario 2: Continuous Joining / Disjoining condition

d. Description:

When an invalid Sensor/Zigbee device tries to connect to AirBoxOne, it sends a network leave command to the sensor. This is a probable scenario where another truck having a Zigbee-based sensor is nearby and tries to connect to AirBoxOne.

e. Captured Waveforms:

During 100mSec Window:

No of Signals = 4

$S1 = S2 + S3 = 2.7637 \text{ mSec}$

$S2 = S3/4 = 0.553 \text{ mSec}$

$S3 = 151.217 - 149.006 = 2.211 \text{ mSec}$

$S4 = 123.963 - 121.677 = 2.286 \text{ mSec}$

Total On Time during 100mSec : $2.7637 + 0.553 + 2.211 + 2.286 = 7.8137 \text{ mSec}$

f. Calculations:

Total On Time: 7.8137 mSec

DCCF (Duty Cycle Correction Factor): $20 \cdot \log(7.8137/100) = -22.1428 \text{ dB}$

Scenario 3: OTA (On another system, with the same module and same series processor)

g. Description:

This scenario is a future provision where AirBoxOne is sending an OTA update to one of the Zigbee sensor/end devices. This feature has not yet been implemented, but it will be tested on the same platform as our other products. Both AirboxOne and our reference products use the same processor platform, OS, Zigbee module, SDK, and packet settings.

h. Captured Waveforms:

During 100mSec Window:

Continued below.

No of Signals = 7

S1 , S5 = 64.776-61.356 = 3.42mSec

S2,S3,S6,S7 = 103.425-103.154 = 0.271mSec

S4 = 70.096-69.076 = 1.02mSec

Total On Time during 100mSec : (2*3.42)+(4*0.271)+1.02= 8.944mSec

i. Calculations:

Total On Time: 8.944 mSec

DCCF (Duty Cycle Correction Factor): $20 \cdot \log(8.944/100) = -20.969\text{dB}$
