Report prepared by

Minh Ly / Senior Project Engineer

Report reviewed by

Krishna Vemuri / EMC Manager

This report is for the exclusive use of Intertek's Client and is provided pursuant to the agreement between Intertek and its Client. Intertek's responsibility and liability are limited to the terms and conditions of the agreement. Intertek assumes no liability to any party, other than to the Client in accordance with the agreement, for any loss, expense or damage occasioned by the use of this report. Only the Client is authorized to permit copying or distribution of this report and then only in its entirety. Any use of the Intertek name or one of its marks for the sale or advertisement of the tested material, product or service must first be approved in writing by Intertek. The observations and test results in this report are relevant only to the sample tested. This report by itself does not imply that the material, product, or service is or has ever been under an Intertek certification program.

1 Introduction and Conclusion

The tests indicated in section 2.0 were performed on the product constructed as described in section 4.0. The remaining test sections are the verbatim text from the actual data sheets used during the investigation. These test sections include the test name, the specified test Method, a list of the actual Test Equipment Used, documentation Photos, Results and raw Data. No additions, deviations, or exclusions have been made from the standard(s) unless specifically noted.

Based on the results of our investigation, we have concluded the product tested **complies** with the requirements of the standard(s) indicated. The results obtained in this test report pertain only to the item(s) tested.

2 Executive Test Plan and Test Summary

Tests were performed to the following standards per FCC Part 15 Subpart C (15.209) and RSS 216 Issue 2.

Radiated Emissions
ANSI 63.10 2013, ICES-001 Issue 5

AC Mains Conducted Emissions
ANSI 63.10 2013, ICES-001 Issue 5

Test Plan & Summary

The EUT shall be tested according to the table below:

FCC Part 15 Subpart C (15.209) & RSS-216 Emissions Test Requirements Summary of Results			
TEST	REFERENCE FCC 15C	REFERENCE RSS-216	RESULTS
Radiated Emissions	15.209	6.2.2.1	Complies
Line Conducted Emissions	15.207	6.2.2.2	Not applicable ¹
Occupied Bandwidth	15.215(c)	RSS-GEN	Complies
Antenna requirement	15.203	RSS-GEN	Complies ²

¹ The EUT does not connect AC mains in normal usage. The EUT is DC powered through the vehicle batteries.

² The EUT utilizes an internal Antenna.

3 Client Information, Environmental Conditions, Performance Level

This EUT was tested at the request of:

Client: JVIS USA, Inc.
52048 Shelby Parkway
Shelby Twp, MI 48315 USA

Contact: Karl Krohn
Telephone: (586) 884-5834
Email: krohn@jvisusallc.com.

4 Description of Equipment Under Test and Variant Models

Equipment Under Test			
Description	Manufacturer	Model/Part Number	Serial Number
15W Wireless Charger	JVIS USA, Inc.	99237200	0004

Receive Date:	May 03, 2021	Test Started:	May 04, 2021
Received Condition:	Good	Test Completed:	May 24, 2021
Type:	Production		

Description of Equipment Under Test (provided by client)

The 15W Wireless Charger is mounted under the surface of the center counsel. It is connected to the vehicle harness and is supplied with 12v DC with ignition on command. There is no communication with the vehicle. When the phone being charged is removed from the charging pad the charging transmission stops, and the device goes into sleep mode until a device is placed back on the charger.

Radio Information (provided by client)

FCC Identifier	2AZX6-1LCID350001
Operating Frequency	Charger coil is operated between 119.62kHz
Number of Channels	1
Type of Modulation	FSK Modulation
Antenna Type	Internal Antenna

Equipment Under Test Power Configuration

Rated Voltage	Rated Power	Rated Frequency	Number of Phases
12V _{DC}	15W	N/A	N/A

Operating modes of the EUT:

No.	Descriptions of EUT Exercising
1	A load was placed on the Charging Pad and continuously charging through inductive wireless power transfer technique.

Software used by the EUT:

No.	Descriptions of EUT Exercising
1	NA

Variant Models:

None.

5 System Setup and Method

Cables					
ID	Description	Length	Shielding	Ferrites	Termination
A	DC Power cable	1m	No	No	DC Power Supply
B	Power cable	2m	No	No	120VAC 60Hz

Support Equipment		
Description	Manufacturer	Model Number
Load	N/A	N/A

5.1 Method:

All other measurements were made in accordance with the procedures in part 2 of CFR 47, ANSI C63.10: 2013, ANSI C63.4-2014 & RSS-GEN Issue 5.

5.2 EUT Block Diagram:

5.3 EUT Picture:

5.4 Justification:

The EUT was configured for testing in a typical configuration, as specified by JVIS USA, Inc.

5.5 Modifications to the EUT

No modifications were made by the manufacturer or Intertek to bring the EUT into compliance for radiated emissions testing.

6 Radiated Emissions (FCC Part 15 Subpart C (15.209) & RSS 216)

6.1 Method:

Tests are performed in accordance with FCC Part 15 Subpart C (15.209) & RSS 216.

TEST SITE: 10m ALSE

10m ALSE: The test facility is located at 1365 Adams Court, Menlo Park, California. The test site is a 10-meter semi-anechoic chamber. The site meets the characteristics of ANSI C63.4:2014. For measurements, a remotely controlled flush-mount metal-top turntable is used to rotate the EUT a full 360 degrees. A remote-controlled non-conductive antenna mast is used to scan the antenna height from one to four meters. Above 1 GHz an antenna mast with boresight capabilities is used.

The A2LA certificate number for this site is 1755-01

Measurement Uncertainty

Measurement	Frequency Range	Expanded Uncertainty (k=2)	Ucisp
Radiated Emissions, 10m	30-200 MHz	4.7 dB	6.3 dB
Radiated Emissions, 10m	200-1000 MHz	4.6 dB	6.3 dB

As shown in the table above our radiated emissions U_{lab} is less than the corresponding U_{CISPR} reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required, based on CISPR 22 and CISPR 11.

6.2 Procedure:

Radiated Measurements Below 30 MHz

During the test the EUT is rotated and the measuring antenna angles are varied during the search for maximum signal level.

Radiated emissions are taken at ten meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. Measurements for below 30 MHz were made at 10 meters. Data results below are corrected for distance back to 30 meters.

Radiated Measurements Above 30 MHz

During the test the EUT is rotated and the measuring antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters.

Radiated emissions are taken at ten meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. Measurements for above 30 MHz were made at 10 meters.

Radiated emission measurements were performed from 9kHz to 1 GHz.
Analyzer resolution is:

200Hz or greater for 9kHz to 150kHz
9 kHz or greater for 150kHz to 30 MHz
120 kHz or greater for 30MHz to 1000 MHz
For those frequencies quasi-peak detector applies

Data includes of the worst-case configuration (the configuration which resulted in the highest emission levels). A sample calculation, configuration photographs and data tables of the emissions are included.

Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation is as follows:

$$FS = RA + AF + CF - AG - DCF$$

Where FS = Field Strength in dB ($\mu\text{V}/\text{m}$)

RA = Receiver Amplitude (including preamplifier) in dB (μV)

CF = Cable Attenuation Factor in dB

AF = Antenna Factor in dB (1/m)

AG = Amplifier Gain in dB

DCF = Distance Correction Factor

Note: FS was measured with loop antenna below 30MHz

6.3 Test Equipment Used:

See Section 8.0 for specific equipment used for this test.

Software Utilized:

Name	Manufacturer	Version
BAT-EMC	NEXIO	3.20.0.14

6.4 Results:

The sample tested was found to Comply.

6.5 Setup Photographs:

Setup Photographs (Continued):

RSS-216, 3m Measurements

FCC 15.209, 10 m Measurements

6.6 Plots/Data:

7 Conducted Emissions (FCC Part 15 Subpart C (15.207) & RSS 216)

7.1 Method

Tests are performed in accordance with FCC Part 15 Subpart C (15.207) & RSS 216.

TEST SITE: 10m ALSE

10m ALSE: The test facility is located at 1365 Adams Court, Menlo Park, California. The test site is a 10-meter semi-anechoic chamber. The site meets the characteristics of ANSI C63.4:2014.

The A2LA certificate number for this site is 1755-01

Measurement Uncertainty

Measurement	Frequency Range	Expanded Uncertainty (k=2)	Ucisp
AC Line Conducted Emissions	150 kHz - 30 MHz	2.1 dB	3.4dB

As shown in the table above our radiated emissions U_{lab} is less than the corresponding U_{CISPR} reference value in CISPR 16-4-2 Table 1, hence the compliance of the product is only based on the measured value, and no measurement uncertainty correction is required, based on CISPR 22 and CISPR 11.

7.2 Procedure:

Measurements are carried out using quasi-peak and average detector receivers in accordance with CISPR 16. An AMN is required to provide a defined impedance at high frequencies across the power feed at the point of measurement of terminal voltage and also to provide isolation of the circuit under test from the ambient noise on the power lines. An AMN as defined in CISPR 16 shall be used.

The EUT is located so that the distance between the boundary of the EUT and the closest surface of the AMN is 0.8m.

Where a flexible mains cord is provided by the manufacturer, this shall be 1m long or if in excess of 1m, the excess cable is folded back and forth as far as possible so as to form a bundle not exceeding 0.4m in length.

The EUT is arranged and connected with cables terminated in accordance with the product specification.

Conducted disturbance is measured between the phase lead and the reference ground, and between the neutral lead and the reference ground. Both measured values are reported.

The EUT, where intended for tabletop use, is placed on a table whose top is 0.8m above the ground plane. A vertical, metal reference plane is placed 0.4m from the EUT. The vertical metal reference-plane is at least 2m by 2m. The EUT shall be kept at least 0.8m from any other metal surface or other ground plane not being part of the EUT. The table is constructed of non-conductive materials. Its dimensions are 1m by 1.5m, but may be extended for larger EUT.

Floor standing EUT are placed on a horizontal metal ground plane and isolated from the ground plane by resting on an insulating material. The metal ground plane extends at least 0.5m beyond the boundaries of the EUT and has minimum dimensions of 2m by 2m.

EUT was placed in transmission mode then tested for conducted emissions per 15.207 to ensure the device complies with 15.207.

7.3 Results:

Result:	Not applicable. The EUT does not connect AC mains in normal usage. The EUT is DC powered through the vehicle batteries.
----------------	---

8 Occupied Bandwidth

FCC 15.215

8.1 Requirements

Intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§15.217 through 15.257, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated. The requirement to contain the designated bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage.

8.2 Procedure

The EUT was setup to transmit in normal operating condition.

Measurements were made with the loop antenna in close proximity of the EUT. Following the procedures of ANSI 63.10: 2013, the 20dB bandwidth measurements were taken. The following plots show Occupied Bandwidth.

8.3 Test Results

Frequency (kHz)	-20 dB Channel Bandwidth (kHz)	99% Channel Bandwidth (kHz)
119.624	1.047	1.411
