5.4. SAMPLE CALCULATION

RADIATED EMISSIONS

Where relevant, the following sample calculation is provided:

$36.5 \text{ dBuV} + 18.7 \text{ dB/m} + 0.6 \text{ dB} - 26.9 \text{ dB} = 28.9 \text{ dBuV/m}$

MAINS CONDUCTED EMISSIONS

Where relevant, the following sample calculation is provided:

Final Voltage (dBuV) = Measured Voltage (dBuV) + Cable Loss (dB) + Limiter Factor (dB) + LISN Insertion Loss.

$36.5 \text{ dBuV} + 0 \text{ dB} + 10.1 \text{ dB} + 0 \text{ dB} = 46.6 \text{ dBuV}$

6. EQUIPMENT UNDER TEST

6.1. DESCRIPTION OF EUT

The EUT is a Dual Cell Low Capacity Sub6 fixed station that supports 5G NR n2, n5, n66 bands. The EUT has 2 SDR radio cards in it that are declared as identical. The EUT supports 2x2 MIMO only, on both cards, for a total of 4Tx.

6.2. MAXIMUM OUTPUT POWER

EIRP/ERP TEST PROCEDURE

ANSI C63.26:2015
KDB 971168 D01 Section 5.6

$$\text{ERP/EIRP} = \text{PMeas} + \text{GT} - \text{LC}$$

where: ERP/EIRP = effective or equivalent radiated power, respectively (expressed in the same units as PMeas, typically dBW or dBm);

PMeas = measured transmitter output power or PSD, in dBm or dBW;

GT = gain of the transmitting antenna, in dBd (ERP) or dBi (EIRP);

LC = signal attenuation in the connecting cable between the transmitter and antenna, in dB.

For devices utilizing multiple antennas, KDB 662911 provides guidance for determining the effective array transmit antenna gain term to be used in the above equation. Please see section 6.4 for antenna gain and correlation explanation.

The transmitter has a maximum average conducted and ERP / EIRP output powers as follows:

6.3. SOFTWARE AND FIRMWARE

The EUT firmware installed during testing was version:

Operating System: Ubuntu 18.04.1

Kernel: Linux 5.4.0-56-lowlatency

Architecture: x86-64.

6.4. MAXIMUM ANTENNA GAIN

The antenna(s) gain, as provided by the manufacturer' are as follows:

Per manufacturer's declaration: Antenna is co-polarized and uncorrelated.

Uncorrelated Directional Gain= G_{ant}

G_{ant} : Gain of Individual Antennas (Same for Each Antenna)

LTE Bands	Frequency range (MHz)	Antenna 1 Peak Gain (dBi)	Antenna 2 Peak Gain (dBi)	Uncorrelated Chains Directional Gain (dBi)
5G NR n2	1930-1990	5.2	5.2	5.2
5G NR n5	869-894	0.8	0.8	0.8
5G NR n66	2110-2200	4.2	4.2	4.2

6.5. WORST-CASE CONFIGURATION AND MODE

The EUT supports the following 5G NRs:

5G NR n2, n5, n66, 15kHz/30kHz SCS, QPSK/16QAM/64QAM, 10MHz and 20MHz bandwidth, full RB configuration only.

The EUT is a desktop device, transmit antennas orientation was investigated in 3 orientations, 0, 45 and 90 Degrees, all final testing is tested with antenna orientation as below as worst case:

- 5G NR n5 (Low Band): 90 degrees
- 5G NR n2 & n66 (Mid Band): 90 degrees

Investigation has been performed based upon conducted average output power, and 30kHz SCS is determined as worse case. All measurements were tested on 30kHz SCS only.

The EUT has 2 identical radio cards that support the same bands and output powers. Conducted Average Output power measurements were performed on both cards, along with a client declaration stating the cards are identical, and it was found that the RF1 radio card was identical to the RF2 radio card. Therefore, antenna port test results of the RF1 card may represent RF2. Radiated emissions was performed with both RF1 and RF2 set to Tx.

Each Radio Card installed in the EUT supports 2x2 MIMO mode only. Additionally, each radio card can transmit simultaneously on the same band and channel. Therefore, for radiated emissions, both radio cards were set to Tx on the same channel, making them 4Tx scans. Since each card is stacking fundamentals, this shall represent simultaneous transmissions investigations as well.

The Worst-Case modulation for all bands was found to be QPSK, based upon total average output power of both chains. Therefore, only QPSK modulation was tested for conducted antenna port testing to represent worst-case. For Radiated Emissions, both QPSK and 16QAM modes were investigated, but only the worst case mode, QPSK, is reported.

The Power settings used by the EUT are as follows:

Band	Frequency	sdrTx_Gain_dB	TxGain
N2	1930-1990	76	1200
N5	869-894	70	1000
N66	2110-2200	82	1200/1000 (10/20MHz BW)

PEAK OUTPUT POWER TEST PROCEDURE

The transmitter output is connected to a power meter.

The power output was measured on the EUT antenna port using SMA cable connected to a power meter via wideband peak power sensor. Peak output power was read directly from power meter.

RESULTS

Test Engineer ID:	22797/44389	Test Date:	2023-04-19; 2023-04-20; 2023-04-26; 2023-05-04; 2023-05-19
--------------------------	-------------	-------------------	--

Note: Since RF1 and RF2 can transmit on the same band and frequency together, power is taken on both radio cards, and summed. For example,

- $RF1_{Ant1} \text{ (dBm)} + RF1_{Ant2} \text{ (dBm)} = RF1_{Total} \text{ (dBm)}$
- $RF2_{Ant1} \text{ (dBm)} + RF2_{Ant2} \text{ (dBm)} = RF2_{Total} \text{ (dBm)}$
- $RF_{Overall} \text{ (dBm)} = RF1_{Total} \text{ (dBm)} + RF2_{Total} \text{ (dBm)}$

9. CONDUCTED TEST RESULTS

9.1. OCCUPIED BANDWIDTH

RULE PART(S)

FCC: §2.1049

LIMITS

For reporting purposes only.

TEST PROCEDURE

The transmitter output was connected to a calibrated coaxial cable and coupler, the other end of which was connected to a spectrum analyzer. The occupied bandwidth was measured with the spectrum analyzer at the middle channel in each band. The 99% and -26dB bandwidths was also measured and recorded.

RESULTS

There is no limit required and power is the same for low, middle, and high channel; therefore, only middle channel was tested.

9.2. EMISSION MASK AND ADJACENT CHANNEL POWER

For Spectrum Emission Mask plots, the Keysight PXA N9030A is configured to sweep with a moving integration window, the width of which can be adjusted to different sizes across the sweep. The window width is configured to be greater than or equal to the required reference bandwidth. The center frequencies of the integration window for the different integration windows was set such that the upper and lower edges of the windows are aligned with the transition points in the reference bandwidths. This is achieved by setting the start / stop frequencies of the window with an offset equal to the reference bandwidth / 2 from the transition point.

TEST PROCEDURE

The transmitter output was configured to operate at maximum power. The band edge emissions were measured at the required operating frequencies in each band on the Spectrum Analyzer.

- For each band edge measurement:
- 1. Set the spectrum analyzer span to include the block edge frequency.
 - 2. Set a marker to point the corresponding band edge frequency in each test case.
 - 3. Set display line at -13 dBm.
 - 4. Set resolution bandwidth to at least 1% of emission bandwidth.

9.3. OUT OF BAND EMISSIONS

TEST PROCEDURE

The RF output of the transmitter was connected to a spectrum analyzer through a calibrated coaxial cable. Sufficient scans were taken to show the out-of-band Emissions, if any, up to 10th harmonic. Multiple sweeps were recorded in maximum hold mode using a peak detector to ensure that the worst-case emissions were caught.

For each out of band emissions measurement:

- Set display line at -13 dBm, according to the band Limit
- Set RBW & VBW to 100 kHz for the measurement below 1 GHz, and 1 MHz for the measurement above 1 GHz. (NOTE: Worst case set RBW/VBW to 1MHz/3MHz)

9.4. FREQUENCY STABILITY

TEST PROCEDURE

FCC §2.1055

- Temp. = 0°C to +50°C
- Voltage = (85% - 115%)

Low voltage, 102VAC, Normal, 120VAC and High voltage, 138VAC.

Frequency Stability vs Temperature:

The EUT is placed inside a temperature chamber. The temperature is set to 20°C and allowed to stabilize. After sufficient soak time, the transmitting frequency error is measured. The temperature is increased by 10 degrees, allowed to stabilize and soak, and then the measurement is repeated. This is repeated until +50°C is reached.

Frequency Stability vs Voltage:

The peak frequency error is recorded (worst-case).

RESULTS

See the following pages. Antenna port 1 is measured on QPSK only as worst case.

9.4.1. 5G NR n2

LIMITS

FCC: §24.235

9.5. PEAK-TO-AVERAGE POWER RATIO

LIMIT

In addition, the peak-to-average power ratio (PAPR) of the transmitter shall not exceed 13 dB for more than 0.1% of the time and shall use a signal corresponding to the highest PAPR during periods of continuous transmission.

TEST PRODECURE

ANSI C63.10 Section 5.2.6 Peak-to-average power ratio

Some regulatory requirements specify a PAPR limit when the output power limits are specified in terms of average power. If it becomes necessary to provide measurement data to demonstrate compliance to a PAPR limit, then the appropriate procedure from those provided in 5.2.3 shall be utilized to determine the peak power (or peak PSD) and the appropriate procedure from those provided in 5.2.4 shall be used to determine the average power (or average PSD). The data from these measurements is then used in Equation (2) to determine the PAPR of a narrowband CW-like signal. See 5.2.3.4 for guidance on determining the PAPR of a broadband noise-like signal.

$$\text{PAPR (dB)} = P_{Pk} \text{ (dBm or dBW)} - P_{Avg} \text{ (dBm or dBW)} \quad (2)$$

Where

PAPR peak-to-average power ratio, in dB

P_{Pk} measured peak power or peak PSD level, in dBm or dBW

P_{Avg} measured average power or average PSD level, in dBm or dBW

RESULT

Both antenna ports are measured on worst case mode, bandwidth, and SCS only as worst case.

The results from all CCDF measurements are passed with 13dB peak-to-average power ratio criteria.

10. RADIATED TEST RESULTS

Radiated measurement using the Field Strength Method

Using the test configuration shown in Figure 6 below, We measure the radiated emissions directly from the EUT and convert the measured field strength or received power to ERP or EIRP, as required, for comparison to the applicable limits. As stated in 5.5.1 of ANSI C63.26-2015, the field strength measurement method using a test site validated to the requirements of ANSI C63.4 is an alternative to the substitution measurement method.

Figure 6 —Test site-up for radiated ERP and/or EIRP measurements

Radiated Power Measurement Calculation According to ANSI C63.26-2015

- a) $E \text{ (dB}\mu\text{V/m)} = \text{Measured amplitude level (dB}\mu\text{V)} + \text{Cable Loss (dB)} + \text{Antenna Factor (dB/m)}.$
- b) $E \text{ (dB}\mu\text{V/m)} = \text{Measured amplitude level (dBm)} + 107 + \text{Cable Loss (dB)} + \text{Antenna Factor (dB/m)}.$
- c) $E \text{ (dB}\mu\text{V/m)} = \text{EIRP (dBm)} - 20\log(D) + 104.8$; where D is the measurement distance (in the far field region) in m.
- d) $\text{EIRP (dBm)} = E \text{ (dB}\mu\text{V/m)} + 20\log(D) - 104.8$; where D is the measurement distance (in the far field region) in m.

So, from d)

The measuring distance is usually at 3m, then $20 \cdot \log(3) = 9.5424$

Then, $\text{EIRP (dBm)} = E \text{ (dB}\mu\text{V/m)} + 9.5424 - 104.8 = E \text{ (dB}\mu\text{V/m)} - 95.2576$

Note: Confidence check of each chamber is performed daily to see if any degradation from expected/normal reading reference data. Ambient check of each chamber is performed monthly.
