六:environmental treatment

1. The metal shell at the red box position has undergone laser engraving treatment.

2. Stick conductive foam at the red box position to ensure sufficient grounding between the motherboard and the metal bottom shell (the conductive foam height of the debugging prototype is about 4mm).

3. Attach a conductive sponge at the blue box position, with a height of 0.5mm, and perform grounding treatment with the metal bottom shell.

4. Stick conductive foam at the yellow box position and ground it to the small board. (Important, significant impact on 4G)

5. Stick conductive foam at the red box position, top to the screen. The ink on the prototype motherboard has not been removed, and these two conductive foam pads are mainly used to interrupt the internal interference path.

6. Stick conductive cloth at the red box position to shield the screen. Remove the black plastic from the yellow box position.

Note: Please optimize the specific environmental treatment methods according to the test report

Technical Requirements:

1. Please use a 50/50 PI substrate with electrolytic copper.
2. The yellow areas are the trace sections, with a matte black oil spray on the surface and bright black printing for the text.
3. The yellow shaded areas are exposed soldering points, which require gold plating treatment.
4. All materials must comply with the environmental protection ROHS standard.
5. The dimensions marked with “*” are key dimensions, with a tolerance of ± 0.03 .

Packaging requirements:

1. PE sealed bag packaging
2. 100 pieces per bag.

Inspection standards:

1. The external dimensions and circuit dimensions are consistent with the drawings and within the controllable tolerance range.
2. There are no wrong or broken lines in the antenna circuit.
3. Perform a 180° bending test on the PPC bending area. If there is no breakage after more than 5 times, it is considered PASS.
3. The silk screen is clear and there are no misprints.
