5.6 Conducted Spurious Emissions

Test Requirement:	FCC part 2.1051, FCC part 27.53(g)
Limit:	-13dBm
Test setup:	 <pre> graph LR SG[Signal Generator] --> EUT[EUT] EUT --> RA[RF Attenuator] RA --> SA[Spectrum Analyzer] </pre>
Test Procedure:	- Connect the EUT to the test equipment as shown in test setup. Begin with the uplink output (donor) port connected to the spectrum analyzer. - Configure the signal generator for AWGN with a 99% OBW of 4.1 MHz, with a center frequency corresponding to the center of the CMRS band under test. - Set the signal generator amplitude to the EUT maximum power level. - Turn on the signal generator RF output and measure the spurious emission power levels with an appropriate measuring instrument as follows. - Set RBW =100kHz(below 1GHz) or 1MHz (above 1GHz). - Set VBW = 3 x RBW. - Select the power averaging (rms) detector. - Sweep time = auto-couple. - Set the analyzer start frequency to the lowest radio frequency signal generated in the equipment, without going below 9 kHz, and the stop frequency to the lower band/block edge frequency minus 100 kHz or 1 MHz, as specified in the applicable rule part. - Sweep time = auto-couple. - Use the peak marker function to identify the highest amplitude level over each measured frequency range. Record the frequency and amplitude and capture a plot for inclusion in the test report. - Reset the analyzer start frequency to the upper band/block edge frequency plus 100 kHz or 1 MHz, as specified in the applicable rule part, and the analyzer stop frequency to 10 times the highest frequency of the fundamental emission. - Use the peak marker function to identify the highest amplitude level over each of the measured frequency ranges. Record the frequency and amplitude and capture a plot for inclusion in the test report. - Repeat b) through d) for each supported frequency band of operation.
Test Instruments:	Refer to section 5.9 for details
Test mode:	Refer to section 5.3 for details
Test results:	Passed

5.7 Noise Limits

Test Requirement:	FCC part 20.21(e)(i)(A), FCC Part 20.21(e)(8)(i)(H)
Limit:	Noise Power = $-102.5 + 20 \text{ LOG}_{10}(\text{Band Center Frequency})$ Variable Noise = -103 dBm/MHz-RSSI
Test setup:	Test setup 1(Maximum transmitter noise power):  Test setup 2(Variable uplink noise timing): 
Test Procedure:	1. Maximum transmitter noise power: a) Connect the EUT to the test equipment as shown in test setup 1. Begin with the uplink output (donor) port connected to the spectrum analyzer. When measuring downlink noise, connect the downlink output (server) port to the spectrum analyzer. b) Set the spectrum analyzer RBW to 1 MHz with the $\text{VBW} \geq 3 \times \text{RBW}$. c) Select the power averaging (rms) detector and trace average over at least 100 traces. d) Set the center frequency of the spectrum analyzer to the center of the CMRS band under test with the $\text{span} \geq 2 \times \text{the CMRS band}$. e) Measure the maximum transmitter noise power level. f) Save the spectrum analyzer plot as necessary for inclusion in the final test report. g) Repeat b) to f) for all operational uplink and downlink bands. h) Connect the EUT to the test equipment as shown in test setup 2 for uplink noise power measurement in the presence a downlink signal. Affirm the coupled path of the RF coupler is connected to the spectrum analyzer. i) Configure the signal generator for AWGN operation with a 99% OBW of 4.1 MHz. j) Set the spectrum analyzer RBW for 1 MHz, $\text{VBW} \geq 3 \times \text{RBW}$, with a power averaging (rms) detector with at least 100 trace averages. k) Set the center frequency of the spectrum analyzer to the center of the CMRS band under test, with the $\text{span} \geq 2 \times \text{the CMRS band}$. l) For uplink noise measurements, set the spectrum analyzer center frequency for the uplink band under test, and tune the signal generator to the center of the paired downlink band. m) Measure the maximum transmitter noise power level while varying the downlink signal generator output level from -90 dBm to -20 dBm. n) Repeat h) through m) for all operational uplink bands. 2. Variable uplink noise timing: a) Set the spectrum analyzer to the uplink frequency to be measured. b) Set the span to 0 Hz, with a sweep time of 10 seconds. c) Set the power level of signal generator to the lowest level of the RSSI-dependent noise.

	d) Select MAX HOLD and increase the power level of signal generator by 10 dB for mobile boosters, and 20 dB for fixed boosters. e) Confirm that the uplink noise decreases to the specified level within 1 second for mobile devices, and within 3 seconds for fixed devices. f) Repeat a) to e) for all operational uplink bands. g) Include plots and summary table in test report.

Test Requirement:	FCC part 20.21(e)(8)(i)(I)
Limit:	-70 dBm/MHz
Test setup:	
Test Procedure:	- Connect the EUT to the test equipment as shown in test setup with the uplink output (donor) port connected to the spectrum analyzer. - Select the power averaging (rms) detector. - Set the spectrum analyzer RBW for 1 MHz with the VBW $\geq 3 \times$ RBW. - Set the center frequency of the spectrum analyzer to the center of the uplink operational band. - Set the span for 0 Hz with a single sweep time for a minimum of 330 seconds. - Start to capture a new trace using MAX HOLD. - After approximately 15 seconds, turn on the EUT power. - After the full spectrum analyzer trace is complete, place a MARKER on the leading edge of the pulse, then use the DELTA MARKER METHOD to measure the time until the uplink becomes inactive. - Affirm that the noise level is below the uplink inactivity noise power limit, as specified by the rules. - Capture the plot for inclusion in the test report. - Measure noise using procedures in a) to f). - Repeat d) through k) for all operational uplink bands.
Test Instruments:	Refer to section 5.9 for details
Test mode:	Refer to section 5.3 for details.
Test results:	Passed
