11.4.1. Test plot

12. Duty Cycle

12.1. Test setup

12.2. Limit

According to ANSI C63-10 paragraph 6.3.2 Operational Configurations a), set the unlicensed wireless device to operate in continuous transmit mode. For unlicensed wireless devices unable to be configured for 100% duty cycle even in test mode, configure the system for the maximum duty cycle supported.

12.3. Test procedure

Duty cycle is measured using the following procedure.

1. Span = Zero span, centered on a middle channel.
2. RBW 1 MHz, VBW 3 MHz
3. Sweep time = Set so that the start of the first transmission and end of the last transmission for the hop are clearly captured.
4. Use a video trigger, where possible with a trigger delay, so that the start of the transmission is clearly observed.
5. Detector = peak
6. Trace mode = Clear write, single sweep.
7. Place markers at the start of the first transmission on the channel and at the end of the last transmission. The dwell time per hop is the time between these two markers.

12.4. Test results

Test mode : LE 1 Mbps

On Time [ms]	Off Time [ms]	Duty Cycle [%]
0.384	0.626	61.3

※Remark

1. The transmitter testing was completed with the transmitter operating at maximum operational mode (maximum possible data length of Bluetooth LE 1 Mbps: 37 bytes)
2. These results are satisfied in accordance with decision rules, including measurements and estimates of measurement uncertainty
