

RADIO TEST REPORT

REPORT NUMBER: M2310030-7 V2

**TEST STANDARD: FCC PART 15 SUBPART C
SECTION 15.247**

CLIENT: METSO AUSTRALIA PTY LTD

DEVICE: WIRELESS WEAR SENSOR

**MODEL: WEARSENSE HUGGER
SENSOR**

FCC ID: 2BFPRMM1774190

DATE OF ISSUE: 1 JULY 2024

EMC Technologies Pty Ltd reports apply only to the specific samples tested under stated test conditions. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical components. EMC Technologies Pty Ltd shall have no liability for any deductions, inferences or generalisations drawn by the client or others from EMC Technologies Pty Ltd issued reports. This report shall not be used to claim, constitute or imply product endorsement by EMC Technologies Pty Ltd.

Accredited for compliance with ISO/IEC 17025 – Testing. The results of tests, calibration and/or measurements included in this document are traceable to Australian/national standards. NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, medical testing, calibration and inspection reports.

This document shall not be reproduced except in full.

REVISION TABLE

Version	Sec/Para Changed	Change Made	Date
1		Initial issue of document	05/04/2024
2		Peak Antenna Gain updated from 0dBi to 0.5dBi	1/07/2024

TEST CERTIFICATE

Device: Wireless Wear Sensor
Model: WearSense Hugger Sensor
Serial Number: Sample C2
Manufacturer: Metso Australia Pty Ltd

Radio: 802.15.4 (STM32WB Chipset, ST Microelectronics)
FCC ID: FCC ID: 2BFPRMM1774190

Tested for: Metso Australia Pty Ltd
Address: Level 2, 1110 Hay Street, Perth Australia 6005
Contact: Piero Velletri
Phone Number: +61 8 9420 5555
Email: Piero.velletri@metso.com

Standard: FCC Part 15, Subpart C, Section 15.247 Operation within the bands
902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz

Result: The Wireless Wear Sensor complied with the applicable requirements
of the above standards. Refer to Report M2310030-7 v2 for full details.

Test Date: 23-25 January 2024

Issue Date: 1 July 2024

Test Engineer:

Ashish Nath

Ian Paul Ng

Attestation:

*I hereby certify that the device(s) described herein were tested as
described in this report and that the data included is that which was
obtained during such testing.*

Authorised Signatory:

Ian Paul Ng

2 TEST FACILITY

2.1 General

EMC Technologies Pty Ltd is accredited by the FCC as a test laboratory able to perform compliance testing for the public. EMC Technologies Pty Ltd has also been designated as a Conformity Assessment Body (CAB) by Australian Communications and Media Authority (ACMA) under the APECTEL MRA and is designated to perform compliance testing on equipment subject to Declaration of Conformity (DoC) and Certification under Parts 15 and 18 of the FCC Commission's rules – **Registration Number 494713 & Designation number AU0001.**

EMC Technologies Pty Ltd is also an ISED Canada recognized testing laboratory – **ISED company number: 3569B and CAB identifier number: AU0001.**

2.2 Test Laboratory/Accreditations

NATA is the Australian National laboratory accreditation body and has accredited EMC Technologies to operate to the IEC/ISO17025 requirements. A major requirement for accreditation is the assessment of the company and its personnel as being technically competent in testing to the standards. This requires fully documented test procedures, continued calibration of all equipment to the National Standard at the National Measurements Institute (NMI) and an internal quality system similar to ISO 9002. NATA has mutual recognition agreements with the National Voluntary Laboratory Accreditation Program (NVLAP) and the American Association for Laboratory Accreditation (A²LA).

All testing in this report has been conducted in accordance with EMC Technologies' scope of NATA accreditation to ISO 17025 for both testing and calibration and ISO 17020 for Inspection – **Accreditation Number 5292.**

The current full scope of accreditation can be found on the NATA website: www.nata.com.au

Accreditation No.5292

This document shall not be reproduced except in full.

3 TEST EQUIPMENT CALIBRATION

Measurement instrumentation and transducers were calibrated in accordance with the applicable standards by an independent NATA registered laboratory such as Keysight Technologies (Australia) Pty Ltd or the National Measurement Institute (NMI) or in-house. All equipment calibration is traceable to Australian national standards at the National Measurements Institute.

Equipment Type	Make/Model/Serial Number	Last Cal. dd/mm/yyyy	Due Date dd/mm/yyyy	Cal. Interval

	Huber & Suhner Sucoflex 104A Sn: 27319 (C-273)	22/01/2024	22/01/2025	1 Year ^{*1}

Note *1. Internal NATA calibration.

Note *2. External NATA / A2LA calibration.

Note *3. Cables are verified before measurements are taken.

4 MEASUREMENT UNCERTAINTY

EMC Technologies has evaluated the equipment and the methods used to perform the emissions testing. The estimated measurement uncertainties for emissions tests shown within this report are as follows:

Radiated Emissions:	9 kHz to 30 MHz	±4.1 dB
	30 MHz to 300 MHz	±5.1 dB
	300 MHz to 1000 MHz	±4.7 dB
	1 GHz to 18 GHz	±4.6 dB
	18 GHz to 40 GHz	±4.6 dB
Peak Output Power:		±1.5 dB

The above expanded uncertainties are based on standard uncertainties multiplied by a coverage factor of k=2, providing a level of confidence of approximately 95%.

Application of measurement uncertainty for this report:

The referenced uncertainty standard specifies that determination of compliance shall be based on measurements without considering measurement instrumentation uncertainty. However, the measurement uncertainty shall appear in the test report.

5 Device Details

(Information supplied by the Client)

The device is a wireless online wear monitoring system that can be fitted to any metallic or ceramic liner independent of the attachment system in use. It monitors wear in real time and tells you when to change liners.

5.1 EUT (Transmitter) Details

Radio:	ST Microelectronics STM32WB
Type:	2.4GHz Transceiver (802.15.4)
Frequency band:	2400 – 2483.5 MHz
Number of Channels:	16
Operating Frequency:	Lowest Channel: 2405 MHz (CH 11) Middle Channel: 2445 MHz (CH 19) Highest Channel: 2480 MHz (CH 26)
Modulation:	O-QPSK
Nominal Bandwidth:	5 MHz
Data Rate:	250 kbit/s
Antenna Model/Type:	P/N: 2450AT18A100, Johanson Technology 2.4GHz Mini Antenna SMT
Antenna Peak Gain:	0.5 dBi

5.2 EUT (Host) Details

Test Sample:	Wireless Wear Sensor
Model:	WearSense Hugger Sensor
Serial Number:	Sample C2
Supply Rating:	3.6V 1/2 AA Lithium battery (built in), Non-rechargeable

5.3 Test Configuration

Testing was performed with the EUT's Transceiver set to transmit continuously at Lowest Channel (2405 MHz), Middle Channel (2445 MHz) and Highest Channel (2480 MHz). STM32CubeMonitor-RF software was used to configure the device and transmitter power level was set to **+2 dBm**.

5.4 Modifications

No modifications were required to achieve compliance.

5.5 Deviations from the Standard

No deviation from the standard.

Accreditation No.5292

This document shall not be reproduced except in full.

6 RESULTS

6.1 §15.203 Antenna Requirement

The test sample's Bluetooth Transceiver incorporates a surface mount Antenna and cannot be replaced by another type.

Antenna Brand: Johanson Technology

Antenna Type: 2.4GHz Mini Antenna SMT, P/N: 2450AT18A100

Antenna Peak Gain: 0.5 dBi

Connector: Not Applicable

The above installation will prevent any unauthorised switching of antennas.

6.2 §15.205 Restricted Bands of Operation

The provisions of the §15.205 restricted bands of operation and §15.209 radiated emissions limits have been met, refer to section 6.7

6.3 §15.207 Conducted Limits

The device is battery DC powered and does not connect directly or indirectly to the AC mains network. Test was not applicable.

6.4 §15.209 Radiated Emission Limits; General Requirements

The provisions of the §15.205 restricted bands of operation and §15.209 radiated emissions limits have been met, refer to section 6.7

6.5 §15.247(a)(2) 6 dB bandwidth

6.5.1 Test Procedure

The tests were performed in accordance with ANSI C63.10: 2013 Clause 11.8 DTS bandwidth.

The 6 dB bandwidth was measured while the device was transmitting with typical modulation applied. The resolution bandwidth of 100 kHz and the video bandwidth of 300 kHz were utilised when measuring the bandwidth.

6.5.2 Limits

In the band 2400-2483.5MHz, the minimum 6 dB bandwidth shall be at least 500 kHz.

6.5.3 Results

Table 6-1: 6 dB Bandwidth

Frequency (MHz)	6 dB Bandwidth (kHz)	Limit (kHz)
2405	1450	≥ 500
2445	1450	≥ 500
2480	1440	≥ 500

11:49:59 23.01.2024

Graph 6-1: 6 dB bandwidth, 2405 MHz

12:13:16 23.01.2024

Graph 6-2: 6 dB bandwidth, 2445 MHz

12:00:08 23.01.2024

Graph 6-3: 6 dB bandwidth, 2480 MHz

6.6 §15.247(b)(3) Peak Output Power

6.6.1 Test Procedure

The maximum peak conducted output power was measured in accordance with ANSI C63.10: 2013 clause 11.9.1.1.

6.6.2 Limits

The maximum peak conducted output power at 2400-2483.5 MHz is 1 Watt or 30 dBm.

6.6.3 Results

Table 6-2: Maximum peak power

Freq. (MHz)	E-Field @ 3 m (dBμV/m)	EIRP (dBm)	Antenna Gain (dBi)	Equivalent Conducted Output Power (dBm)	Limit (dBm)	Results
2405	85.69	-9.54	0.5	-10.04	30	Complied
2445	86.66	-8.57	0.5	-9.07	30	Complied
2480	86.98	-8.25	0.5	-8.75	30	Complied

The measured radiated field strength is converted to equivalent conducted output power for checking compliance (KDB 558074 D01 Section 3).

12:07:21 23.01.2024

Graph 6-6: Maximum EIRP, 2480MHz

6.7 §15.247(d) Out-of-Band/Spurious Emissions

6.7.1 Test procedure

Radiated out-of-band/spurious emissions measurements were performed in a semi-anechoic chamber compliant with ANSI C63.4: 2014.

The test frequency range was sub-divided into smaller bands with the defined resolution bandwidths to permit reliable display and identification of emissions.

Frequency range (MHz)	Measurement Bandwidth (kHz)	Measurement Distance (m)	Antenna
0.009 to 0.150	0.2	3	0.6 metre loop antenna
0.150 to 30	9	3	
30 to 1000	120	3	
1000 to 18 000	1000	3	Standard gain or broadband horn
18 000 to 40 000	1000	1	

EUT was set at a height of 0.8 m for measurements below 1000 MHz and set at a height of 1.5 m for measurements above 1000 MHz.

The sample was slowly rotated with the spectrum analyser set to Max-Hold. This was performed for at least two antenna heights. When an emission was located, it was positively identified, and its maximum level was found by rotating the automated turntable and by varying the antenna height. For below 1000 MHz the emissions were measured with a Quasi-Peak detector, and for above 1000 MHz the emissions were measured with Peak and Average detectors.

Measurements on the worst axis are presented.

The measurement data for each frequency range was corrected for cable losses, antenna factors and preamplifier gain. This process was performed for both horizontal and vertical polarisations of the measurement antenna.

6.7.2 Test setup

Below 1 GHz:

Above 1GHz:

6.7.3 Evaluation of field strength

Field strengths were calculated automatically by the software using pre-stored calibration data. The method of calculation is shown below:

$$E = V + AF - G + L$$

Where: E = Radiated Field Strength in dB μ V/m.

V = EMI Receiver Voltage in dB μ V.

AF = Antenna Factor in dB/m (stored as a data array).

G = Preamplifier Gain in dB (stored as a data array).

L = Cable loss in dB (stored as a data array of Insertion Loss versus frequency).

6.7.4 Limits

The limit applied is in accordance with the out-of-band/spurious emissions limit defined in §15.247(d).

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

The in-band peak PSD in 100 kHz bandwidth were measured on all three channels. The maximum PSD level was used to establish the limit. However, the general limits of §15.209 apply for the restricted bands of operation defined in §15.205.

Table 6-3: 100 kHz reference level measurement

Freq. (MHz)	Peak at 3 m (dB μ V/m)	Established Limit @ 3 m (dB μ V/m)
2480	83.89	63.89

6.7.5 Transmitter Spurious Emissions: 9 kHz to 30 MHz

All emissions measured in the frequency band 9kHz - 30MHz complied with the requirements of the standard.

Graph 6-7: Transmitter Spurious Emissions, 9 kHz – 30 MHz, 2405 MHz

No peaks were measured within 10 dB of the limit.

Graph 6-8: Transmitter Spurious Emissions, 9 kHz – 30 MHz, 2445 MHz

No peaks were measured within 10 dB of the limit.

Graph 6-9: Transmitter Spurious Emissions, 9 kHz – 30 MHz, 2480 MHz

No peaks were measured within 10 dB of the limit.

6.7.6 Transmitter Spurious Emissions: 30 - 1000 MHz

All emissions measured in the frequency band 30 – 1000 MHz complied with the requirements of the standard.

Graph 6-10: Transmitter Spurious Emissions, 30 – 1000 MHz, 2405 MHz

Table 6-4: Transmitter Spurious Emissions, 30 – 1000 MHz, 2405 MHz

Peak	Frequency (MHz)	Polarisation	Quasi-Peak		
			Level (dB μ V/m)	Limit (dB μ V/m)	Margin (dB)

6.7.8 Transmitter Spurious Emissions: 18 – 26 GHz

All emissions measured in the frequency band 18 – 26 GHz complied with the requirements of the standard.

Peak Measurement:

Graph 6-19: Transmitter Spurious Emissions, 18 – 26 GHz, 2405 MHz, Peak

No peaks were measured within 10 dB of the limit.

Graph 6-20: Transmitter Spurious Emissions, 18 – 26 GHz, 2445 MHz, Peak

No peaks were measured within 10 dB of the limit.

Graph 6-21: Transmitter Spurious Emissions, 18 – 26 GHz, 2480 MHz, Peak

No peaks were measured within 10 dB of the limit.

Average Measurement:

Graph 6-22: Transmitter Spurious Emissions, 18 – 26 GHz, 2405 MHz, Average

No peaks were measured within 10 dB of the limit.

Graph 6-23: Transmitter Spurious Emissions, 18 – 26 GHz, 2445 MHz, Average

No peaks were measured within 10 dB of the limit.

Graph 6-24: Transmitter Spurious Emissions, 18 – 26 GHz, 2480 MHz, Average

No peaks were measured within 10 dB of the limit.

6.8 §15.247(d) Band Edge Emission Measurements

Band-edge radiated measurements were done in accordance with ANSI C63.10 clause 6.10. All emissions measured near the lower and higher band edge complied with the requirements of §15.247.

11:53:57 23.01.2024

Graph 6-25: Band Edge Emission, Lower Band-edge

Measurement Type	Freq (MHz)	Measurement (dBμV/m)	Limit (dBμV/m)	Result
Peak	2483.5	56.70	74	Complied
Average	2483.5	49.92	54	Complied

6.9 §15.247(e) Power Spectral Density

6.9.1 Test procedure

Maximum power spectral density level in the fundamental emission was measured in accordance with ANSI C63.10: 2013 Clause 11.10

6.9.2 Limits

The maximum peak conducted power spectral density (PSD) is 8 dBm per 3 kHz.

6.9.3 Results

Table 6-15: Power spectral density

Freq. (MHz)	E-Field @ 3 m (dBμV/m)	EIRP (dBm)	Antenna Gain (dBi)	Equivalent Conducted Output PSD (dBm)	Limit (dBm)	Results
2405	71.10	-24.13	0.5	-24.63	8	Complied
2445	71.33	-23.90	0.5	-24.4	8	Complied
2480	72.28	-22.95	0.5	-23.45	8	Complied

The measured radiated field strength is converted to equivalent conducted output power for checking compliance (KDB 558074 D01 Section 3).

6.10 §15.247(i) Maximum Permissible Exposure

The EUT complied with the applicable maximum permissible exposure levels. Refer to EMC Technologies report M2310030-4 and M2310030-5.

6.11 §15.215 Occupied Bandwidth – 99% power

6.11.1 Test procedure

The bandwidth containing 99% power of the transmitted signal was measured using the procedure from ANSI C63.10 section 6.9.

6.11.2 Limits

The 99% power should be contained within the frequency band 2400 – 2483.5 MHz.

6.11.3 Results

Table 6-16: Occupied Bandwidth

Freq. (MHz)	99% Bandwidth (MHz)	Lower Frequency (MHz)	Upper Frequency (MHz)	Result
2405	2.384	2.40391	2.40629	Complied
2445	2.374	2.44390	2.44628	Complied
