## **FCC 2.1093 SAR Test Report**

**for**

**LG Electronics Inc.**

**222, LG-ro, Jinwi-myeon Pyeongtaek-Si, Gyeonggi-Do,  
17709 Republic of Korea**

**Product Name : Notebook Computer**  
**Model Name : (1)16Z90U (2)16ZD90U (3)16ZB90U  
(4)16ZG90U**  
**Brand : LG**  
**FCC ID : 2BO3L-16Z90U**

The test report is based on a single evaluation of one sample of the above-mentioned products. It does not imply an assessment of the whole production and does not permit the use of the test lab logo.  
The report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

## TEST REPORT

Applicant : LG Electronics Inc.  
EUT Description  
(1) Product : Notebook Computer  
(2) Model : (1)16Z90U (2)16ZD90U (3)16ZB90U (4)16ZG90U  
(3) Brand : LG  
(4) Power Supply : DC 20V, 3.25A

Applicable Standards:

Title 47FCC CFR, Part 2 §2.1093

**Audix Technology Corp.** tested the equipment mentioned in accordance with the requirements set forth in the above standards. Test results indicate that the equipment tested is capable of demonstrating compliance with the requirements as documented within this report.

**Audix Technology Corp.** does not assume responsibility for any conclusions and generalizations drawn from the test results with regard to other specimens and samples.

## 5. SAR MEASUREMENT SYSTEM

### 5.1. Definition of Specific Absorption Rate (SAR)

SAR is related to the rate at which energy is absorbed per unit mass in an object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and general population/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational/controlled exposure limits are higher than the limits for general population/uncontrolled.

The SAR definition is the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dv) of a given density ( $\rho$ ). The equation description is as below:

$$SAR = \frac{d}{dt} \left( \frac{dW}{dm} \right) = \frac{d}{dt} \left( \frac{dW}{\rho dv} \right)$$

SAR is expressed in units of Watts per kilogram (W/kg)

SAR measurement can be related to the electrical field in the tissue by

$$SAR = \frac{\sigma |E|^2}{\rho}$$

Where:  $\sigma$  is the conductivity of the tissue,  $\rho$  is the mass density of the tissue and E is the RMS electrical field strength.

### 5.2. SPEAG DASY System

DASY system consists of high precision robot, probe alignment sensor, phantom, robot controller, controlled measurement server and near-field probe. The robot includes six axes that can move to the precision position of the DASY5 software defined. The DASY software can define the area that is detected by the probe. The robot is connected to controlled box. Controlled measurement server is connected to the controlled robot box. The DAE includes amplifier, signal multiplexing, AD converter, offset measurement and surface detection. It is connected to the Electro-optical coupler (ECO). The ECO performs the conversion from the optical into digital electric signal of the DAE and transfers data to the PC.

**Fig-3.1 DASY6 System Setup**

### 5.2.1. Robot

The DASY6 system uses the high precision robots from Stäubli SA (France). For the 6-axis controller system, the robot controller version (DASY5: CS8c) from Stäubli is used. The Stäubli robot series have many features that are important for our application:

- High precision (repeatability  $\pm 0.035$  mm)
- High reliability (industrial design)
- Jerk-free straight movements
- Low ELF interference (the closed metallic construction shields against motor control fields)

### 5.2.2. Probes

#### 5.2.4. Phantom

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                          |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Model           | Twin SAM                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |
| Construction    | The shell corresponds to the specifications of the Specific Anthropomorphic Mannequin (SAM) phantom defined in IEEE 1528 and IEC 62209-1. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. A cover prevents evaporation of the liquid. Reference markings on the phantom allow the complete setup of all predefined phantom positions and measurement grids by teaching three points with the robot. |                                                                                                                                                                          |

| Construction    | Phantom for compliance testing of handheld and body-mounted wireless devices in the frequency range of 30 MHz to 6 GHz. ELI is fully compatible with the IEC 62209-2 standard and all known tissue simulating liquids. ELI has been optimized regarding its performance and can be integrated into our standard phantom tables. A cover prevents evaporation of the liquid. Reference markings on the phantom allow installation of the complete setup, including all predefined phantom positions and measurement grids, by teaching three points. The phantom is compatible with all SPEAG dosimetric probes and dipoles. |                                                                                                                                                                             |

| Model        | Mounting Device                                                                                                                                                                                                                                                                                                                                                                                                               |  |
| Construction | In combination with the Twin SAM Phantom or ELI4, the Mounting Device enables the rotation of the mounted transmitter device in spherical coordinates. Rotation point is the ear opening point. Transmitter devices can be easily and accurately positioned according to IEC, IEEE, FCC or other specifications. The device holder can be locked for positioning at different phantom sections (left head, right head, flat). |                                                                                     |
| Material     | POM                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                     |

|              |                                                                                                                                                                                                                                                                                         |                                                                                      |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| Model        | Laptop Extensions Kit                                                                                                                                                                                                                                                                   |  |
| Construction | Simple but effective and easy-to-use extension for Mounting Device that facilitates the testing of larger devices according to IEC 62209-2 (e.g., laptops, cameras, etc.). It is lightweight and fits easily on the upper part of the Mounting Device in place of the phone positioner. |                                                                                      |
| Material     | POM, Acrylic glass, Foam                                                                                                                                                                                                                                                                |                                                                                      |

### 5.2.6. Reference Dipole

|                  |                                                                                                                                                                      |                                                                                       |

### 5.2.7. Tissue Simulating Liquids

For SAR measurement of the field distribution inside the phantom, the phantom must be filled with homogeneous tissue simulating liquid to a depth of at least 15 cm. For head SAR testing, the liquid height from the ear reference point (ERP) of the phantom to the liquid top surface is larger than 15 cm. For body SAR testing, the liquid height from the center of the flat phantom to the liquid top surface is larger than 15 cm. The nominal dielectric values of the tissue simulating liquids in the phantom and the tolerance of 5% are listed in Table-5.1.

The dielectric properties of the head tissue simulating liquids are defined in IEEE 1528 and FCC OET 65 Supplement C Appendix C. For the body tissue simulating liquids, the dielectric properties are defined in FCC OET 65 Supplement C Appendix C. The dielectric properties of the tissue simulating liquids were verified prior to the SAR evaluation using an Agilent 85070D Dielectric Probe Kit and an Agilent Network Analyzer.

**Table-5.1 Targets of Tissue Simulating Liquid**

| Target Frequency<br>[MHz] | Target<br>Permittivity ( $\epsilon_r$ ) | Range of<br>$\pm 5\%$ | Target<br>Conductivity<br>$\sigma$ [s/m] | Range of<br>$\pm 5\%$ |
|---------------------------|-----------------------------------------|-----------------------|------------------------------------------|-----------------------|
| 750                       | 41.9                                    | 39.805 ~ 43.995       | 0.89                                     | 0.846 ~ 0.935         |
| 835                       | 41.5                                    | 39.425 ~ 43.575       | 0.90                                     | 0.855 ~ 0.945         |
| 900                       | 41.5                                    | 39.425 ~ 43.575       | 0.97                                     | 0.922 ~ 1.019         |
| 1450                      | 40.5                                    | 38.475 ~ 42.525       | 1.20                                     | 1.140 ~ 1.260         |

| $\sigma_{\text{liquid temp. unc.}}$ (%)   | 2,3   |    |       |       |       | 2,7   | 2,6   |       |       |        |

NOTE 1 Multiple columns under a single frequency indicate optional recipes.

NOTE 2 Recipe source numbers: 1 verified by different labs, 2 Reference [59], 3 developed by IT'IS Foundation, 4 developed by IT'IS Foundation, 5 Reference [60].

NOTE 3 The values of  $\epsilon_{\text{liquid temp. unc.}}$  and  $\sigma_{\text{liquid temp. unc.}}$  are liquid temperature uncertainties described in O.9.6, based on measurements of the applicable liquid recipes given above. These are not part of the original publications but have been subsequently developed by the project team.

NOTE 4 The recipes at 8 000 MHz and 10 000 MHz are sufficiently broadband that they cover the frequency range of 6 000 MHz to 10 000 MHz within a tolerance of  $\pm 10$  % for permittivity and conductivity.

### 5.3. SAR System Verification

The system check verifies that the system operates within its specifications. It is performed daily or before every SAR measurement. The system check uses normal SAR measurements in the flat section of the phantom with a matched dipole at a specified distance. The system verification setup is shown as below.

The validation dipole is placed beneath the flat phantom with the specific spacer in place. The distance spacer is touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The power meter PM1 measures the forward power at the location of the system check dipole connector. The signal generator is adjusted for the desired forward power (250 mW is used for 700 MHz to 3 GHz, 100 mW is used for 3.5 GHz to 6 GHz) at the dipole connector and the power meter PM2 is read at that level. After connecting the cable to the dipole, the signal generator is readjusted for the same reading at power meter PM2.

After system check testing, the SAR result will be normalized to 1W forward input power and compared with the reference SAR value derived from validation dipole certificate report. The deviation of system check should be within 10 %.

### 5.3.1. SAR System Verification Result

### 5.3.2. SAR System Check Data

Date: 8/23/2025

Test Laboratory: Audix\_SAR Lab

#### System Check\_H2450

**DUT: D2450V2 - SN888**

Communication System: UID 0, CW (0); Frequency: 2450 MHz; Duty Cycle: 1:1

Medium parameters used:  $f = 2450$  MHz;  $\sigma = 1.766$  S/m;  $\epsilon_r = 40.147$ ;  $\rho = 1000$  kg/m<sup>3</sup>

Phantom section: Flat Section

DASY Configuration:

- Probe: EX3DV4 - SN3855; ConvF(7.15, 7.5, 7.88) @ 2450 MHz; Calibrated: 9/17/2024
- Sensor-Surface: 2mm (Mechanical Surface Detection),  $z = 1.0, 31.0$
- Electronics: DAE4 Sn1337; Calibrated: 3/21/2025
- Phantom: ELI V5.0 (20deg probe tilt); Type: QD OVA 002 AA; Serial: 1170
- DASY52 52.10.4(1527); SEMCAD X 14.6.14(7483)

**P=250mW/Area Scan (5x5x1):** Measurement grid:  $dx=20$ mm,  $dy=20$ mm

Maximum value of SAR (measured) = 18.6 W/kg

**P=250mW/Zoom Scan (5x5x7)/Cube 0:** Measurement grid:  $dx=8$ mm,  $dy=8$ mm,  $dz=5$ mm

Reference Value = 90.04 V/m; Power Drift = -0.05 dB

Peak SAR (extrapolated) = 22.4 W/kg

**SAR(1 g) = 12.5 W/kg; SAR(10 g) = 6.01 W/kg**

Smallest distance from peaks to all points 3 dB below = 9.7 mm

Ratio of SAR at M2 to SAR at M1 = 52.7%

Maximum value of SAR (measured) = 17.9 W/kg

## 5.4. SAR Measurement Procedure

According to the SAR test standard, the recommended procedure for assessing the peak spatial-average SAR value consists of the following steps:

- (a) Power reference measurement
- (b) Area scan
- (c) Zoom scan
- (d) Power drift measurement

The SAR measurement procedures for each of test conditions are as follows:

- (a) Make EUT to transmit maximum output power
- (b) Measure conducted output power through RF cable
- (c) Place the EUT in the specific position of phantom
- (d) Perform SAR testing steps on the DASY system
- (e) Record the SAR value

### 5.4.1. Area &Zoom Scan Procedure

According to IEC/IEEE 62209-1528, the resolution for Area and Zoom scan is specified in the table below.

| Items                                 | ≤2 GHz | 2-3 GHz | 3-4 GHz | 4-5 GHz | 5-6 GHz |
|---------------------------------------|--------|---------|---------|---------|---------|
| Area Scan<br>( $\Delta x, \Delta y$ ) | ≤15mm  | ≤12mm   | ≤12mm   | ≤10mm   | ≤10mm   |
| Zoom Scan<br>( $\Delta x, \Delta y$ ) | ≤8mm   | ≤5mm    | ≤5mm    | ≤4mm    | ≤4mm    |
| Zoom Scan<br>( $\Delta z$ )           | ≤5mm   | ≤5mm    | ≤4mm    | ≤3mm    | ≤2mm    |
| Zoom Scan<br>Volume                   | ≥30mm  | ≥30mm   | ≥28mm   | ≥25mm   | ≥22mm   |

Note:

When zoom scan is required and report SAR is  $\leq 1.4$  W/kg, the zoom scan resolution of  $\Delta x / \Delta y$  (2-3GHz:  $\leq 8$  mm, 3-4GHz:  $\leq 7$  mm, 4-6GHz:  $\leq 5$  mm) may be applied.

According to IEC/IEEE 62209-1528, if the zoom scan measured as specified in the preceding paragraphs complies with both of the following items, or if the peak spatial-average SAR is below 0.1 W/kg, no additional measurements are needed:

- (1) The smallest horizontal distance from the local SAR peaks to all points 3 dB below the SAR peak shall be larger than the horizontal grid steps in both x and y directions ( $\Delta x, \Delta y$ ). This shall be checked for the measured zoom scan plane conformal to the phantom at the distance  $z_{M1}$ .
- (2) The ratio of the SAR at the second measured point (M2) to the SAR at the closest measured point (M1) at the x, y location of the measured maximum SAR value shall be at least 30%.

#### 5.4.2. Volume Scan Procedure

The volume scan is used for assess overlapping SAR distributions for antennas transmitting in different frequency bands. It is equivalent to an oversized zoom scan used in standalone measurements. The measurement volume will be used to enclose all the simultaneous transmitting antennas. For antennas transmitting simultaneously in different frequency bands, the volume scan is measured separately in each frequency band. In order to sum correctly to compute the 1g aggregate SAR, the EUT remain in the same test position for all measurements and all volume scan use the same spatial resolution and grid spacing. When all volume scan were completed, the software, SEMCAD postprocessor can combine and subsequently superpose these measurement data to calculating the multiband SAR.

#### 5.4.3. Power Drift Monitoring

All SAR testing is under the EUT install full charged battery and transmit maximum output power. In DASY measurement software, the power reference measurement and power drift measurement procedures are used for monitoring the power drift of EUT during SAR test. Both these procedures measure the field at a specified reference position before and after the SAR testing. The software will calculate the field difference in dB. If the power drift more than 5%, the SAR will be retested.

#### 5.4.4. Spatial Peak SAR Evaluation

The procedure for spatial peak SAR evaluation has been implemented according to the test standard. It can be conducted for 1g and 10g, as well as for user-specific masses. The DASY software includes all numerical procedures necessary to evaluate the spatial peak SAR value.

The base for the evaluation is a "cube" measurement. The measured volume must include the 1g and 10g cubes with the highest averaged SAR values. For that purpose, the center of the measured volume is aligned to the interpolated peak SAR value of a previously performed area scan.

The entire evaluation of the spatial peak values is performed within the post-processing engine (SEMCAD). The system always gives the maximum values for the 1g and 10g cubes. The algorithm to find the cube with highest averaged SAR is divided into the following stages:

- (a) Extraction of the measured data (grid and values) from the Zoom Scan
- (b) Calculation of the SAR value at every measurement point based on all stored data (A/D values and measurement parameters)
- (c) Generation of a high-resolution mesh within the measured volume
- (d) Interpolation of all measured values form the measurement grid to the high-resolution grid
- (e) Extrapolation of the entire 3-D field distribution to the phantom surface over the distance from sensor to surface
- (f) Calculation of the averaged SAR within masses of 1g and 10g

#### 5.4.5. SAR Averaged Methods

In DASY, the interpolation and extrapolation are both based on the modified Quadratic Shepard's method. The interpolation scheme combines a least-square fitted function method and a weighted average method which are the two basic types of computational interpolation and approximation.

Extrapolation routines are used to obtain SAR values between the lowest measurement points and the inner phantom surface. The extrapolation distance is determined by the surface detection distance and the probe sensor offset. The uncertainty increases with the extrapolation distance. To keep the uncertainty within 1% for the 1 g and 10 g cubes, the extrapolation distance should not be larger than 5 mm.

## 6. SAR MEASUREMENT EVALUATION

### 6.1. Test Configuration and EUT setting

The standalone SAR test exclusion shall be refer to FCC § 1.1307 (b)(3)(i)(B) SAR-Based exemption which device determined the distance from antenna to user/bystander. The formula is

$$\begin{aligned} P_{th} \text{ (mW)} &= ERP_{20cm} (d / 20)^x && \text{for distance } d \leq 20\text{cm} \\ P_{th} \text{ (mW)} &= ERP_{20cm} && \text{for distance } 20\text{cm} < d \leq 40\text{cm} \\ x &= -\log_{10} \left( \frac{60}{ERP_{20cm} \sqrt{f}} \right) \\ ERP_{20cm} \text{ (mW)} & \quad \begin{aligned} &0.3 \text{ GHz} \leq f < 1.5 \text{ GHz: } 2040f \\ &1.5 \text{ GHz} \leq f \leq 6 \text{ GHz: } 3060 \end{aligned} \end{aligned}$$

F = GHz

$P_{th}$ (mW) = available maximum time-average power or effective radiated power, whichever is greater.

D = the separation distance (cm)

From KDB 616217 D04 section 4.2 to 4.3, The SAR exclusion threshold can be applied to KDB 447498 to determine if SAR necessary test.

Test program “DRTU” is used for enabling EUT BT or WLAN function under continues transmitting and choosing data rate/ channel and supported stable power rating.

## 6.2. EUT Testing Position

SAR-Based exemption table

| Centre Frequency (MHz) | 5        | 10       | 15       | 20       | 25       | Distance(mm) |
|------------------------|----------|----------|----------|----------|----------|--------------|
| 2450                   | 3.000    | 10.000   | 22.000   | 38.000   | 59.000   | Power(mW)    |

| 5500                   | 1.000    | 6.000    | 14.000   | 26.000   | 41.000   |              |
| 5800                   | 1.000    | 6.000    | 14.000   | 25.000   | 40.000   |              |
|                        | 30       | 35       | 40       | 45       | 50       | Distance(mm) |
| 2450                   | 83.000   | 111.000  | 143.000  | 179.000  | 219.000  | Power(mW)    |
| 5200                   | 61.000   | 84.000   | 110.000  | 110.000  | 110.000  |              |
| 5500                   | 59.000   | 82.000   | 108.000  | 108.000  | 108.000  |              |
| 5800                   | 58.000   | 80.000   | 106.000  | 106.000  | 106.000  |              |
|                        | 7        | 10       | 15       | 20       | 25       | Distance(cm) |
| 2450                   | 415.000  | 819.000  | 1770.000 | 3060.000 | 3060.000 | Power(mW)    |
| 5200                   | 350.000  | 731.000  | 1689.000 | 3060.000 | 3060.000 |              |
| 5500                   | 345.000  | 725.000  | 1683.000 | 3060.000 | 3060.000 |              |
| 5800                   | 341.000  | 719.000  | 1678.000 | 3060.000 | 3060.000 |              |
|                        | 30       | 33       | 35       | 37       | 40       | Distance(cm) |
| 2450                   | 3060.000 | 3060.000 | 3060.000 | 3060.000 | 3060.000 | Power(mW)    |
| 5200                   | 3060.000 | 3060.000 | 3060.000 | 3060.000 | 3060.000 |              |
| 5500                   | 3060.000 | 3060.000 | 3060.000 | 3060.000 | 3060.000 |              |
| 5800                   | 3060.000 | 3060.000 | 3060.000 | 3060.000 | 3060.000 |              |

The SAR testing required mode is listed as below.

| Antenna | Front Face | Rear Face | Top Side | Bottom Side | Left Side | Right Side | Back Side |
|---------|------------|-----------|----------|-------------|-----------|------------|-----------|
| WLAN    |            |           |          | √           |           |            | √         |

According to SAR-Based exemption table, the laptop only need evaluate bottom side and screen side.

### 6.3. Tissue Calibration Result

The dielectric parameters of the liquids were verified prior to the SAR evaluation using Agilent Dielectric Probe Kit and Agilent E5071C Vector Network Analyzer.

## 6.4. SAR Exposure Limits

SAR assessments have been made in line with the requirements of IEEE-1528, FCC Supplement C, and comply with ANSI/IEEE C95.1-1992 “Uncontrolled Environments” limits. These limits apply to a location which is deemed as “Uncontrolled Environment” which can be described as a situation where the general public may be exposed to an RF source with no prior knowledge or control over their exposure.

Limits for General Population/Uncontrolled Exposure (W/kg)

| Type Exposure                                               | Uncontrolled Environment Limit |
|-------------------------------------------------------------|--------------------------------|
| Spatial Peak SAR (1g cube tissue for brain or body)         | 1.60 W/kg                      |
| Spatial Average SAR (whole body)                            | 0.08 W/kg                      |
| Spatial Peak SAR<br>(10g for hands, feet, ankles and wrist) | 4.00 W/kg                      |

## 6.5. Conducted Power Measurement

### Note:

1. Per KDB 447498 D01 the reported SAR is the measured SAR value adjusted for maximum tune-up tolerance.  
Scale Factor = tune-up limit power (mW)/EUT Conducted power (mW), where tune-up limit is the maximum rated power among all production units.  
Scale SAR(W/kg)= Measured SAR(W/kg)\* Scaling Factor
2. Per KDB 447498 D01 for each exposure position, if the highest output channel reported SAR  $\leq 0.8$  W/kg, other channels SAR testing is not necessary.
3. Per KDB 248227 D01, for OFDM transmission configuration in the 2.4G and 5G bands. An initial test configuration is determined by the highest maximum output power including tune-up tolerance. When multiple transmission modes(802.11a/g/n/ac/ax) have same maximum power, largest channel bandwidth, lowest order modulation and lowest data rate, lowest order 802.11 mode is selected.( i.e. a, g, n, ac then ax)
4. Per KDB 248227 D01, when the highest reported SAR for the initial test configuration (when applicable, include subsequent highest output channels), according to the initial test position or fixed exposure position requirements, is adjusted by the ratio of the subsequent test configuration to initial test configuration specified maximum output power and the adjusted SAR is  $\leq 1.2$  W/kg, SAR is not required for that subsequent test configuration.
5. Per KDB 248227 D01, U-NII-1 and U-NII-2A bands have the same specified maximum output and tolerance; SAR is measured for U-NII-2A band first. Adjusted SAR of U-NII-2A band is  $\leq 1.2$  W/kg, SAR is not required for U-NII-1 band. When different maximum output power is specified for the bands, begin SAR measurement in the band with higher specified maximum output power. The highest reported SAR for the tested configuration is adjusted by the ratio of lower to higher specified maximum output power for the two bands. When the adjusted SAR is  $\leq 1.2$  W/kg, SAR is not required for the band with lower maximum output power in that test configuration; otherwise, each band is tested independently for SAR.
6. Per KDB 248227 D01, When different maximum output power is specified for the bands, begin SAR measurement in the band with higher specified maximum output power. The highest reported SAR for the tested.
7. Pursuant section 2.8.1(2) KDB 865664 D01, when the original highest measured SAR is  $\geq 0.80$  W/kg, repeat that measurement once.
8. Pursuant section 2.8.1(3) KDB 865664 D01, perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is  $> 1.20$  or when the original or repeated measurement is  $\geq 1.45$  W/kg (~ 10% from the 1-g SAR limit)

### 6.5.1. For WLAN Function

| Type of Network | Frequency<br>(MHz) | Average Output Power (dBm) |                  |                 |                  |                  |                 | SAR Test |
|-----------------|--------------------|----------------------------|------------------|-----------------|------------------|------------------|-----------------|----------|
|                 |                    | AUX-ANT                    |                  |                 | Main-ANT         |                  |                 |          |
|                 |                    | Average<br>Power           | Tune-Up<br>Limit | Scale<br>Factor | Average<br>Power | Tune-Up<br>Limit | Scale<br>Factor |          |

## TEST GRAPH RESULT

(Model: 16Z90U)

● **WiFi 2.4G (Worst Plots Test Position: Back)**

Date: 8/23/2025

Test Laboratory: Audix\_SAR Lab

**P7 802.11b CH7 2442MHz Back Main**

**DUT: 16Z90U**

Communication System: UID 0, WIFI 2.4G 802.11B (0); Frequency: 2442 MHz; Duty Cycle: 1:1

Medium parameters used:  $f = 2442 \text{ MHz}$ ;  $\sigma = 1.759 \text{ S/m}$ ;  $\epsilon_r = 40.146$ ;  $\rho = 1000 \text{ kg/m}^3$

Phantom section: Flat Section

DASY Configuration:

- Probe: EX3DV4 - SN3855; ConvF(7.15, 7.5, 7.88) @ 2442 MHz; Calibrated: 9/17/2024
- Sensor-Surface: 2mm (Mechanical Surface Detection),  $z = 1.0, 31.0$
- Electronics: DAE4 Sn1337; Calibrated: 3/21/2025
- Phantom: ELI V5.0 (20deg probe tilt); Type: QD OVA 002 AA; Serial: 1170
- DASY52 52.10.4(1527); SEMCAD X 14.6.14(7483)

**Area Scan (6x9x1):** Measurement grid:  $dx=20\text{mm}$ ,  $dy=20\text{mm}$

Maximum value of SAR (measured) = 0.158 W/kg

**Zoom Scan (5x5x7)/Cube 0:** Measurement grid:  $dx=8\text{mm}$ ,  $dy=8\text{mm}$ ,  $dz=5\text{mm}$

Reference Value = 0.8120 V/m; Power Drift = -0.15 dB

Peak SAR (extrapolated) = 0.293 W/kg

**SAR(1 g) = 0.145 W/kg; SAR(10 g) = 0.072 W/kg**

Smallest distance from peaks to all points 3 dB below = 14.8 mm

Ratio of SAR at M2 to SAR at M1 = 47.8%

Maximum value of SAR (measured) = 0.211 W/kg
