1 - GENERAL INFORMATION

1.1 Product Description for Equipment Under Test (EUT)

Client Information

Applicant: Maicotech
Address of applicant: Crkviste 5A, Belgrade
Manufacturer: Maicotech
Address of manufacturer: Crkviste 5A, Belgrade

General Description of E.U.T

Product Description: Basis
Trade Mark: Maicotech
Model No.: 1.0
Test Model No.: 1.0
Sample No.: Y25C1406E01WC
Rated Supply: AC 120-240V, 50/60Hz
Highest internal frequency: <108MHz
Adapter Information: N/A

Remark: * The test data gathered are from the production sample provided by the manufacturer.

General Description of Test Auxiliary

AUX Description:	Manufacturer	Model No.	Remark
/	/	/	/

1.2 Test Standards

The following Declaration of Conformity report of EUT is prepared in accordance with FCC Rules and Regulations Part 15 Subpart B

The objective of the manufacturer is to demonstrate compliance with the described above standards.

1.3 Test Summary

For the EUT described above. The standards used were FCC Part 15 Subpart B for Emissions

Table 1: Tests Carried Out Under FCC Part 15 Subpart B

Standard	Test Items	Test Results
FCC Part 15 Subpart A	Conduction Emission (0.15MHz to 30MHz)	PASS
FCC Part 15 Subpart A	Radiation Emission (30MHz to 1GHz)	PASS
FCC Part 15 Subpart A	Radiation Emission (Above 1GHz)	PASS

"N/A" means "not applicable"

Note 1: All results of Pass/Fail in this report are opinions expressed by Shenzhen QC Testing Laboratory Co., Ltd. based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only.

Note 2: In the configuration tested, the EUT complied with the standards specified above.

1.4 Test Methodology

All measurements contained in this report were conducted with CISPR 16-1-1, radio disturbance and immunity measuring apparatus, and CISPR 16-2-3, Method of measurement of disturbances and immunity.

All measurement required was performed at **Shenzhen QC Testing Laboratory Co., Ltd.** at East of 1/F., Building E, Xinghong Science Park, No.111, Shuike Road, Fenghuanggang, Xixiang Street, Bao'an District, Shenzhen, Guangdong, China.

1.5 Test Facility

Test Firm: Shenzhen QC Testing Laboratory Co., Ltd.

The testing quality ability of our laboratory meet with "Quality Law of People's Republic of China" Clause 19. The testing quality system of our laboratory meets with ISO/IEC-17025 requirements. This approval result is accepted by MRA of APLAC.

Our test facility is recognized, certified, or accredited by the following organizations:

CNAS – Registration No.: L8464

The EMC Laboratory has been accredited by CNAS, and in compliance with ISO/IEC 17025:2017 General Requirements for testing Laboratories.

A2LA Certificate Number: 6759.01

The EMC Laboratory has been accredited by A2LA, and in compliance with ISO/IEC 17025:2017 General Requirements for testing Laboratories.

FCC Registration Number: 561109

The EMC Laboratory has been registered and fully described in a report filed with the (FCC) Federal Communications commission.

IC Registration Number: 29628

CAB identifier: CN0141

The EMC Laboratory has been registered and fully described in a report filed with the (IC) Industry Canada.

1.6 Measurement Uncertainty

Parameter	Uncertainty
Disturbance Voltage (9kHz-0.15MHz)	$\pm 2.25\text{dB}$
Disturbance Voltage (150kHz-30MHz)	$\pm 1.80\text{dB}$
Radiated electromagnetic disturbance (9kHz-30MHz)	$\pm 2.66\text{dB}$
Radiated electromagnetic disturbance (30MHz-1000MHz)	$\pm 4.04\text{dB}$
Radiated electromagnetic disturbance (1000MHz-18000MHz)	$\pm 4.70\text{dB}$
Radiated electromagnetic disturbance (18GHz-40GHz)	$\pm 4.80\text{dB}$
Note: This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of $k=2$.	

2 - SYSTEM TEST CONFIGURATION

2.1 Justification

The system was configured for testing in a typical fashion (as only used by a typical user).

2.2 EUT Exercise Software

The EUT exercising program used during radiated and conducted testing was designed to exercise the various system components in a manner similar to a typical use. The software offered by manufacturer, can let the EUT being **HIGH Mode**.

2.3 Special Accessories

As shown in section 2.5, interface cable used for compliance testing is shielded as normally supplied by **Millplan Electric Appliance (ShenZhen) Co., Limited** and its respective support equipment manufacturers.

2.4 Equipment Modifications

The EUT tested was not modified by QCT.

2.5 Configuration of Test System

3 - DISTURBANCE VOLTAGE AT THE MAINS TERMINALS

3.1 Limit of Disturbance Voltage at the Mains Terminals

Frequency Range (MHz)	Class A Limits (dBμV)		Class B Limits (dBμV)	
	Quasi-Peak	Average	Quasi-Peak	Average
0.150~0.500	79.0	66.0	66.0~56.0*	56.0~46.0*
0.500~5.000	73.0	60.0	56.0	46.0
5.000~30.00	73.0	60.0	60.0	50.0

Note:

- (1) The tighter limit applies at the band edges.
- (2) The limit of " * " marked band means the limitation decreases linearly with the logarithm of the frequency in the range.
- (3) The test result calculated as following:
 Measurement Value = Reading Level+Correct Factor
 Correct Factor = Insertion Loss + Cable Loss +Attenuator Factor(if use)
 Margin Level = Measurement Value- Limit Value

3.2 EUT Setup

The setup of EUT is according with ANSI C63.4-2014 measurement procedure. The specification used was the FCC Rules and Regulations Part 15 Subpart B limits.

The EUT was placed center and the back edge of the test table.

The AV cables were draped along the test table and bundled to 30-40cm in the middle.

The spacing between the peripherals was 10 cm.

Maximum emission emitted from EUT was determined by manipulating the EUT, support equipment, interconnecting cables and varying the mode of operation and the levels in the final result of the test were recorded with the EUT running in the operating mode that maximum emission was emitted.

3.3 Instrument Setup

The test receiver was set with the following configurations:

Test Receiver Setting:

Frequency Range.....150 KHz to 30 MHz
Detector.....Peak & Quasi-Peak & Average
Sweep Speed.....Auto
IF Band Width.....9 KHz

3.4 Test Procedure

During the conducted emission test, the EUT power cord was connected to the auxiliary outlet of the first Artificial Mains.

Maximizing procedure was performed on the six (6) highest emissions to ensure EUT compliance using all installation combination.

All data was recorded in the peak detection mode. Quasi-peak and Average readings were only performed when an emission was found to be marginal (within -10 dB μ V of specification limits). Quasi-peak readings are distinguished with a "QP". Average readings are distinguished with a "AV".

3.5 Summary of Test Results

According to the data in section 3.8, the EUT complied with the FCC Part 15 B Conducted margin, with the worst margin reading of:

3.6 Disturbance Voltage Test Data

Temperature (°C)	23
Humidity (%RH)	52
Barometric Pressure (kpa)	101
EUT	Basis
M/N	1.0
Operating Mode	Normal working

Test data see following pages

Remark: (1) When PK reading is less than relevant limit 20dB, the QP reading and AV reading will not be recorded.
(2) Where QP reading is less than relevant AV limit, the AV reading will not be measured

4 - RADIATED DISTURBANCES

4.1 Limit of Radiated Disturbances

☒ Limit for radiated emissions at frequencies up to 1 GHz for class A equipment

Frequency (MHz)	Distance (Meters)	Field Strengths Limits (μV/m)	Field Strengths Limits (dBμV/m)
30 ~ 88	3	300	49.5
88~216	3	500	54.0
216 ~ 960	3	700	56.9
Above 960	3	1000	60.0

☐ Limit for radiated emissions at frequencies up to 1 GHz for class B equipment

Frequency (MHz)	Distance (Meters)	Field Strengths Limits (μV/m)	Field Strengths Limits (dBμV/m)
30 ~ 88	3	100	40.0
88~216	3	150	43.5
216 ~ 960	3	200	46.0
Above 960	3	500	54.0

☒ Limit for radiated emissions at frequencies above 1 GHz for class A equipment

Frequency (MHz)	Distance (Meters)	Field Strengths Limits (dBμV/m)	
Above 960	3	Peak	Average
		80	60

☐ Limit for radiated emissions at frequencies above 1 GHz for class B equipment

Frequency (MHz)	Distance (Meters)	Field Strengths Limits (dBμV/m)	
Above 960	3	Peak	Average
		74	54

Note:

- (1) The tighter limit applies at the band edges.
- (2) Emission level (dBuV/m)=20log Emission level (uV/m).
- (3) The test result calculated as following:
 Measurement Value =Reading Level +Correct Factor
 Correct Factor = Antenna Factor +Cable Loss -Amplifier Gain(ifuse)
 Margin Level= Measurement Value-Limit Value

4.2 EUT Setup

The radiated emission tests were performed in the in the 3-meter anechoic chamber, using the setup accordance with the ANSI C63.4-2014. The specification used was the FCC Part 15 Subpart B limits.

The EUT was placed on the center of the test table.

Maximum emission emitted from EUT was determined by manipulating the EUT, support equipment, interconnecting cables and varying the mode of operation and the levels in the final result of the test were recorded with the EUT running in the operating mode that maximum emission was emitted.

Block diagram of test setup (In chamber)

The test setup for emission measurement from 30 MHz to 1 GHz.

The test setup for emission measurement above 1 GHz

4.3 Test Receiver Setup

According to FCC Part 15 rule, the frequency was investigated from 30 to 1000 MHz. During the radiated emission test, the test receiver was set with the following configurations:

Test Receiver Setting:

Detector..... Peak & Quasi-Peak & Average
IF Band Width..... 120KHz/1MHz

Frequency Range..... 30MHz to 1000MHz
Turntable Rotated..... 0 to 360 degrees
Antenna Position:
Height..... 1m to 4m
Polarity..... Horizontal and Vertical

4.4 Test Procedure

Maximizing procedure was performed on the highest emissions to ensure that the EUT complied with all installation combinations.

All data was recorded in the peak detection mode. Quasi-peak readings performed only when an emission was found to be marginal (within -10 dB μ V of specification limits), and are distinguished with a "QP" in the data table.

4.5 Corrected Amplitude & Margin Calculation

The Corrected Amplitude is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain from the Amplitude reading. The basic equation is as follows:

$$\text{Corr. Ampl.} = \text{Indicated Reading} + \text{Antenna Factor} + \text{Cable Factor} - \text{Amplifier Gain}$$

The "Margin" column of the following data tables indicates the degree of compliance with the applicable limit. For example, a margin of -7dB μ V means the emission is 7dB μ V below the maximum limit for Subpart B. The equation for margin calculation is as follows:

$$\text{Margin} = \text{Limit} - \text{Corr. Ampl.}$$

4.6 Radiated Emissions Test Result
