

(FCC) TEST REPORT

Report No. : BVT-RH-FCR-250011(1)

Applicant

- Name : CHEMTRONICS CO., LTD.
- Address : 31, Baeil-gil, Jeondong-myeon, Sejong-si, Republic of Korea

Test Item

- Product Name : EGADS 7 Inch single monitor
- Model Name : WTD070F-CTXEG0

Manufacturer

- Name : Chemtrovina(Vietnam)
- Address : Nhon Trach II – Loc Khang IP, Nhon Trach District, Dong Nai Province, VietNam

Date of Test : 2025.12.01. ~ 2025.12.02 / 2025.12.23

Test Method Used : FCC CFR 47, Part 15. Subpart C-15.225
ANSI C 63.10-2020

Test Result : ☒ Pass ☐ Fail

Note : None

This test report is not related to KOLAS accreditation

Affirmation Tested by Technical Manager
Name : Kwak, Yun-Kyoung (Signature) Name : Jung, Ho-Cheol (Signature)

2 Summary of Test Results

The EUT has been tested according to the following specifications

Applied Standard : FCC Part 15, Subpart C 15.225					
FCC Part Section(s)	Test Description	Limit	Test Condition	Test Result	Reference
15.225(e)	Carrier frequency tolerance	Within in ($\pm$) 0.01 % or ($\pm$) 1 356 Hz	Conducted	PASS	Section 4.1
15.225(a) ~ (d)	Field strength of radiated emission	15.225(a) ~ (d)	Radiated	PASS	Section 4.2
15.203, 15.247	Antenna requirement	FCC 15.203	-	PASS	Section 4.3
15.207	AC Conducted emission	< FCC 15.207 limits	AC Line Conducted	PASS	Section 4.4
2.1049	20 dB bandwidth measurement	-	Conducted	PASS	Section 4.5

2.1 Decision Rules for Statement of Conformity

QUA-52 Decision Rule(QA Document) was applied.

Step 1) : Reference Check, Daily Check, Peripheral device Check

Step 2) : Re-test Procedure (Repeat the test maximum 3 times, Different Test Engineer)

- 1) If the original test results are subject to retesting and the judgement is unclear, the retest is carried out.
- 2) If the result of the first retest is the same as the initial test, the judgement is made based on the value.
- 3) If the result of the first retest differ from the results of the initial test, the second re-test is carried out.
- 4) After completion of the second retest, the average of the three test results is determined as the final result. However, if the deviation of the three test values is more than 5 % of the reference value, the technical manager should review the reproducibility of the test from the beginning.

2.2 Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the EUT as specified in CISPR 16-4-2

Measurement Items	Expanded Uncertainty $U = kU_c (k = 2)$	
Frequency Tolerance	6.57 kHz	
Bandwidth	0.50 kHz	
Radiated Spurious Emissions	1 GHz Below	5.06 dB
	1 GHz Above	5.00 dB

This uncertainty represents an expanded uncertainty expressed at approximately the 95 % confidence level using a coverage factor of $k = 2$.

3 General Information

3.1 General Description of EUT

Equipment Class	Low Power Communication Device Transmitter (DXX)
Product name	EGADS 7 Inch single monitor
FCC ID	2BS7B-WTD070FCTXEG0
Model	WTD070F-CTXEG0
Additional model name	-
Power Supply	AC/DC Adaptor, output: DC 12 V
Modulation Type	ASK
Transfer Rate	-
Operating Frequency	13.56 MHz
Output Power	54.65 dBμV/m @ 30 meter
Antenna Type	Internal PCB Antenna
Antenna Gain	-
H/W Version	Rev 1.0
S/W Version	V1.00.V019 (Main Board)
F/W Version	V1.00.V019 (Main Board)
Serial Number	070F202510210001

3.2 Tested sample and Tested companion device information

Type	Model	Note
Notebook	P165G004	S/N: BJ5D894
Adapter	YHY-12002000K	P/N: DS120024C14-MP

3.3 Description of Test Mode

The EUT has been tested with all modes of operating conditions to determine the worst case emission characteristics.

Test Mode		Tested Frequency (MHz)		
TM 1	RFID(Normal)	13.56	-	-
TM 2	RFID(Reading)	13.56	-	-

3.4 INSTRUMENT CALIBRATION

The measuring equipment, which was utilized in performing the tests documented herein, has been calibrated in accordance with the manufacturer's recommendations for utilizing calibration equipments, which is traceable to recognized national standards.

3.5 EUT CONFIGURATION

The EUT configuration for testing is installed on RF field strength measurement to meet the Commissions requirement and operating in a manner that intends to maximize its emission characteristics in a continuous normal application.

3.6 General Description of Applied Standards

Generally the tests were performed according to the specifications of the standard, it must comply with the requirements of the following standards.

FCC CFR 47, Part 15. Subpart C-15.225

ANSI C 63.10-2020

All test items in this test report have been performed and recorded as per the above standards.

3.7 Test Equipment

Test Equipment is traceable to the National Institute of Standards and Technology (NIST). Measurement antenna used during testing were calibrated in accordance to the requirements of ANSI C63.5-2017.

4 Test Results

4.1 Carrier Frequency Tolerance

The frequency tolerance of the carrier signal shall be maintained within $\pm 0.01\%$ of the operating frequency Over a temperature variation of - 20 degrees to + 50 degrees C at normal supply voltage, and for a variation in the primary supply from 85 % to 115 % of the rated supply voltage at a temperature of 20 degrees C. For battery operated equipment, the equipment tests shall be performed using a new battery.

4.1.2 Test Environment conditions

- Ambient temperature : (20 - 21) °C • Relative Humidity : (43 - 44) % R.H.

4.1.3 Measurement Procedure

Before measurements are made the equipment shall have reached thermal balance in the Test chamber period. and then it is normal operating for about 15 minutes after thermal balance has been reached. For tests at the extreme temperature, the equipment shall be left in the test chamber until thermal balance is attained, then the standby or receive condition for a period of a few minute after which the equipment shall meet the specified requirements. The test data sheet recorded measured value by frequency counter

4.2 Field strength of radiated emissions

4.2.1 Standard Applicable [FCC §15.225 (a) ~ (d)]

(a) The Field strength of any emissions within the band 13.553-13.567 MHz shall not exceed 15,848 $\mu\text{V}/\text{m}$ at 30 meter

(b) Within the bands 13.410-13.553 MHz and 13.567-13.710 MHz, the field strength of any emissions shall not exceed 334 micro volts/meter at 30 meter

(c) Within the bands 13.110-13.410 MHz and 13.710-14.010 MHz, the field strength of any emissions shall not exceed 106 micro volts/meter at 30 meter

(d) The Field strength of any emissions appearing outside of the 13.110-14.010 MHz band shall not exceed The general radiated emission limits in §15.209

Above required standard (a ~ c) and (d) is brief describe table as follows

§ 15.225 [(a) ~ (c)] : Limit for in-band field strength

Frequency Band (MHz)	Limit		Measurement distance (meter)
	($\mu\text{V}/\text{m}$)	(dB $\mu\text{V}/\text{m}$)	
13.553 – 13.567	15,848	84.00	30
13.410 – 13.553 13.567 – 13.710	334	50.47	30
13.110 – 13.410 13.710 – 14.010	106	40.50	30

§15.209. limits for radiated emissions measurements

Frequency Band	Limit [$\mu\text{V}/\text{m}$]	Limit [dB $\mu\text{V}/\text{m}$]	Measurement distance (meter)	Detector
0.009 – 0.490	2 400/F (kHz)	-	300	
0.490 – 1.705	2 4000/F (kHz)	-	30	
1.705 – 30.0	30	29.54	30	Quasi peak
30 - 88	100 **	40.0	3	Quasi peak
88 - 216	150 **	43.5	3	Quasi peak
216 - 960	200 **	46.0	3	Quasi peak
Above 960	500	54.0	3	Peak & Average

** fundamental emissions from intentional radiators operation under this Section shall not be located in the frequency bands 54-72 MHz, 76-88 MHz, 174-216 MHz, or 470-806 MHz. However, operation within these Frequency bands is permitted under other sections of this Part Section 15.231 and 15.241

§15.205. Restrict Band of Operation

Only spurious emissions are permitted in any of the frequency bands listed below ;

[MHz]	[MHz]	[MHz]	[GHz]
0.090 - 0.110	16.42 - 16.423	399.9 - 410	4.5 - 5.15

13.36 - 13.41			

** Until February 1, 1999, this restricted band shall be 0.490-0.510

4.2.2 Test Environment conditions

- Ambient temperature : (20 - 21) °C • Relative Humidity : (43 - 44) % R.H.

4.2.3 Measurement Procedure

The measurements procedure of the transmitter radiated E-field is as following describe method.

The test is performed in a Shield chamber to determine the accurate frequencies, after maximum emissions level will be checked on a test chamber and measuring distance is 3 m from EUT to test antenna.

(The chamber is ensured that comply with at least 6 dB above the ambient noise level)

- ① The EUT was powered ON with continuously operating mode and placed on a 0.8 meter high non-conductive table on the reference ground plane.
- ② The test antenna was used on Horn antenna for above 1 GHz, and if the below 1 GHz, broad-band antenna and Loop antenna were used for below 30 MHz and it's antenna positioned in both the horizontal and vertical plane was location at EUT during the test for maximized the emission measurement.
- ③ The output of the test antenna will be connected to a measuring receiver, and it is set to tuned over the frequency range according to required standard
- ④ The measuring detector type of the measurement receiver is based on average value of measurement instrumentation employing a CISPR Quasi Peak detector according to required standard and for above 1 GHz, set the spectrum analyzer on a average and peak detector for the provisions in §15.35 and investigated frequency range is set the spectrum analyzer according to §15.33.
- ⑤ The fundamental frequency at which a relevant radiated signal component is detected, the test antenna will be raised and lowered through the specified range of heights in horizontal and vertical polarized orientation, until an maximum signal level is detected on the measuring receiver.
- ⑥ The transmitter is position x,y,z axis on rotating through 360 degrees, until the maximum signal level is detected by the measuring receiver.
- ⑦ The receiver is scanned from requested measuring frequency band and then the maximum meter reading is recorded. The radiated emissions were measured with required standard.

- The measurement results are obtained as described below:

Result(dB μ V/m) = Reading(dB μ V) + Antenna factor(dB/m)+ CL(dB) + other applicable factor (dB)

- According to §15.33 (a)(1), Frequency range of radiated measurement is performed the tenth harmonic.
- ※ if necessary, additionally receiver is adopted high-pass filter and preamp because lower radiated signal
- ※ The transmitter radiated spectrum was investigated from 9 kHz to 1 GHz

4.2.4 Test Configuration

Radiated emission setup, below 30 MHz

Radiated emission setup, below 1 000 MHz

4.3 Antenna requirement

4.3.1 Standard applicable [FCC §15.203]

For intentional device, according to §15.203, an intentional radiator shall be designed to ensure that no antenna other than furnished by responsible party shall be used with the device.

The use of a permanently attached antenna or of an antenna that user a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section.

The manufacturer may design the unit so that broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

4.3.2 Antenna details

Frequency Band	Antenna Type	Gain [dBi]	Results
13.56 MHz	Internal PCB Antenna	N/A	Compliance

4.4 AC Power Conducted emissions

4.4.1 Standard Applicable [FCC §15.207(a)]

For intentional radiator that is designed to be connected to the public utility(AC)power line, the radio frequency. Voltage that is conducted back onto the AC power line on any frequencies hopping mode within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50 μ H/50 ohms line Impedance stabilization network(LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

§15.207 limits for AC line conducted emissions;

Frequency of Emission(MHz)	Conducted Limit (dB μ V)	
	Quasi-peak	Average
0.15 ~ 0.5	66 to 56 *	56 to 46 *
0.5 ~ 5	56	46
5 ~ 30	60	50

* Decreases with the logarithm of the frequency

4.4.2 Test Environment conditions

• Ambient temperature : (20 - 21) °C • Relative Humidity : (43 - 44) % R.H.

4.4.3 Measurement Procedure

EUT was placed on a non- metallic table height of 0.8 m above the reference ground plane. Cables connected to EUT were fixed to cause maximum emission. Test was made with the antenna positioned in both the horizontal and vertical planes of polarization. The measurement antenna was varied in height above the conducting ground plane to obtain the Maximum signal strength.

4.5 20 dB Bandwidth measurement

4.5.1 Standard Applicable [FCC §2.1049]

The 20 dB bandwidth is measured with a spectrum analyzer connected via a receive antenna placed near the EUT while the EUT is operating in transmission mode.

4.5.2 Test Environment conditions

- Ambient temperature : (20 - 21) °C • Relative Humidity : (43 - 44) % R.H.
