3.1. Test equipment

Equipment	Manufacturer	Model No.	Serial No.	Cal Due To
ENA Network Analyzer	Agilent	E5071C	MY46900684	2026/03/28
Software	SHENZHEN XINGHANG	XH.PassiveTest	V2.7.6	N/A
Software	SHENZHEN XINGHANG	XHDP	V2.8.0	N/A

The diagram illustrates the experimental setup for measuring the dynamic mechanical properties of a polymer film. A PC System is connected to a Network Analyzer, which is connected to a circular resonator. The resonator consists of a central rod (1) with a film (2) attached, surrounded by a circular structure (3) with a central hole (4) and a diameter D_{AUT} . The resonator is connected to a power source (5).

- (1) Set up the antenna to be measured. Set up the antenna and mark the cross reference line at the center of the antenna port surface to be measured.
- (2) Connect the cable connector and adjust the down dip Angle (electrically tuned antenna).
- (3) Open the test software, create the test project, and configure the test port.
- (4) Use test software for automatic testing and save test data of electromagnetic field distribution.
- (5) Change the port, down dip Angle, or test frequency (if necessary), and repeat steps (3) to (4) until all status data to be measured is collected.
- (6) After near and far field exchange, the three-position spherical pattern of the antenna to be tested is obtained, and the Theta and Phi angles of the position where the maximum level of the three-position spherical pattern is located are found. The horizontal plane pattern curve of the antenna to be tested is obtained by cutting according to equal Theta Angle, and the vertical plane pattern of the antenna to be tested is cancelled by cutting according to equal Phi Angle. Then the radiation parameters of the horizontal plane and vertical plane pattern of the antenna to be measured are obtained by using the processing method similar to that of the far field.
