Section 3 Equipment Details**Equipment Under Test (EUT)**

Date received:	8 th January 2026		
EUT name:	SS200LR (915MHz) Irradiance Meter		
Model:	SS200LR		
PMN:	SS200LR (915MHz) Irradiance Meter		
HVIN:	601A100 rev7, 601A101 rev6, 901A100 rev3		
FVIN:	V0.71		
FCC ID:	2BV6F-SS200LR		
IC:	TBC		
Serial no:	25S-0109		
EUT description:	The EUT is used to conduct solar site surveys. It will measure the effectiveness of a solar panel installation by measuring the irradiance, temperature, angle and direction at a potential site. The EUT contains an SRD 915.0MHz radio for communication with the PV1525-IV installation analyser.		
Antenna	Internal strip antenna		
Peak Antenna Gain	4.07 dBi		
Transmission	Digital Transmission System (DTS)		
Modulation schemes	LoRa – Spread factor 10		
Operating frequency bands	902MHz to 928MHz		
No of units tested:	One		
EUT power:	3Vdc (2x 1.5V Alkaline AA Battery)		
Highest internal frequency:	924 MHz		
Size of EUT (mm)	Width: 80	Length: 148	Height: 33
Mode/s of operation:	Continuous transmission of packetized data. Ch0 915MHz Continuous transmission of packetized data. Ch5 920MHz Continuous transmission of packetized data. Ch9 924MHz		
Test software:	The EUT was programmed to the correct test modes via buttons on the front panel. The EUT was supplied with the output power level set to a level of 6 in control software.		
Modifications incorporated during testing:	None		

Ports and Cables	Cable Length	Screened/ unscreened	Connected to
-	-	-	-

Channel Number	Frequency
0	915 MHz
1	916 MHz
2	917 MHz
3	918 MHz
4	919 MHz

Compliance Statement

The SS200LR (915MHz) Irradiance meter, as tested, was shown to meet requirements of the standards listed in Section 4 of this report.

Decision Rule Statement

The Decision Rule is applied on the basis of the ILAC-G8:09/2019

This guidance document has been prepared to assist laboratories in the use of decision rules when declaring statements of conformity to a specification or standard as required by ISO/IEC 17025:2017

Where a result is considered marginal in respect of its proximity to the limit line, for example, the customer would be made aware of situation so that they can make an informed decision on how to proceed.

A binary decision rule exists when the result is limited to two choices (pass or fail). A non-binary decision rule exists when multiple terms may express the result (pass, conditional pass, conditional fail, fail). These are further explained below.

The laboratory recommends to use Binary Statement for Simple Acceptance Rule ($w = 0$)

Statements of conformity are reported as:

- Pass - the measured value is below the acceptance limit, $AL = TL$.
- Fail - the measured value is above the acceptance limit, $AL = TL$

Section 5 Spurious Emission Results – Radiated and Conducted

Test Specification

FCC Rule Part	47CFR 15.247 (d)
Standard	ANSI C63.10-2020+Cor. 1-2023+C63.10a-2024 + Errata to C63.10a-2024
Measurement Uncertainty Radiated tests	The reported uncertainty of measurement $y \pm U$, where expended uncertainty U is based on a standard uncertainty multiplied by a coverage factor of $k=2$, providing a level of confidence of approximately 95% is +/- 6.26dB for the frequency range 30MHz to 1GHz +/- 5.14dB for the frequency range from 1GHz to 6GHz +/- 5.45dB for the frequency range from 6GHz to 18GHz
Measurement Uncertainty Conducted tests	± 1.4 dB

12th January

16th January

5.1.4 Test Area

LAB 1 (SAC)

5.1.5 Tested by

L Trickett

5.1.6 Test Setup

The EUT was configured in the SAC on an 80cm high polystyrene table.

The measurement was performed with an antenna to EUT separation distance of 3m. The results were maximised in orientation 0-360 degrees and height 1-4m.

Figure 1 Test Setup for E-Field Measurements from 30MHz to 1GHz

Note 1 : With the EUT de-energized the ambient radio noise and signals met the 6dB peak detection requirement of ANSI C63.10-2020+Cor. 1-2023+C63.10a-2024 + Errata to C63.10a-2024.

Note 2 : There were no significant environmental temperature changes during the test duration and hence it was not considered necessary to consider any variation in cable loss.

Operating Mode During testing

During spurious emission testing the equipment under test was set to transmit at the same frequency on the following channels:

Ch0 915MHz.
Ch5 920MHz.
Ch9 924MHz.

The equipment under test was pre-scanned using peak detection. Final measurements were performed with the equipment under test operating on Ch0 915MHz.

5.1.10 Emissions measurements**5.1.11 Date of Test**16th January 2026**5.1.12 Test Area**

LAB 1 (SAC)

5.1.13 Tested by

J Beevers

5.1.14 Test Setup

The EUT was configured in the SAC on a 1.5m high table. Exploratory measurements on the EUT were carried out to identify suspect frequencies and worst case orientations, see Section 5.1.15.

The measurement was then performed with an antenna to EUT separation distance of 3m.

The antenna was kept in the “cone of radiation” from the EUT and pointed at the area both in azimuth and elevation using the tilt mechanism on the antenna mast.

The results were maximised in orientation 0-360 degrees and height 1-4m.

Figure 5.4.7.1: Test Setup for Final E-Field Measurements from 1GHz to 18GHz

- Note 1 : With the EUT de-energized the ambient radio noise and signals met the 6dB peak detection requirement of ANSIC63.10-2020/Cor1-2023.
- Note 2 : There were no significant environmental temperature changes during the test duration and hence it was not considered necessary to consider any variation in cable loss.
- Note 3: On all swept and final measurements made between 1GHz and 10GHz a Microtronics HPM50108 1.2GHz high-pass filter was placed in the measurement chain between the antenna and pre-amplifier in order to prevent the artificial generation of harmonics within the pre-amplifier.

5.1.15 Exploratory Radiated Emission Maximization

During exploratory testing, suspect emissions from the EUT were identified both in terms of the frequency and directionality. This was achieved by manually positioning the antenna close to the EUT and also by scanning it over all sides of the EUT whilst observing a spectral display. The typical distance between the surface of the EUT and the scanning antenna was circa 30cm.

Frequency (GHz)	Mode of operation	EUT face *	Emissions Angle (w.r.t. turntable)	Height	Polarization

Table 3 Electric Field Emissions Peaks, 1GHz to 10GHz – Operation on channel 0 915MHz

Figure 6 Electric field emissions Plot, 1GHz to 10GHz, Operation on channel 5 920MHz - Peak detector scan

Figure 7 Electric field emissions Plot, 1GHz to 10GHz, Operation on channel 9 924MHz – Peak detector scan

5.1.17 Example field strength calculation

The total average corrections are shown in the above table. This correction figure consists of Preamplifier gain (PG), Antenna factor (AF); and Cable loss (CL), and where necessary distance extrapolation factor (dB).

Field strength (FS) is calculated as follows:

$$\text{FS (dB}\mu\text{V/m)} = \text{Indicated Signal Level (dB}\mu\text{V/m)} - \text{PG (dB)} + \text{AF (dB)} + \text{CL (dB)}$$

5.1.18 Sample Data

From Figure 5 and table 3, The Average level at 4.575GHz is calculated as follows:

$$\text{FS (dB}\mu\text{V/m)} = 49.7(\text{dB}\mu\text{V/m}) - 54.8(\text{dB}) + 35.0(\text{dB/m}) + 7.1(\text{dB}) = 37.0\text{dB}\mu\text{V/m}$$

Conducted Spurious Emissions 9kHz to 10GHz**5.1.19 Limits**

Frequency (MHz)	Limit, 47CFR 15.247(d)
	Peak
0.009 – 10000	-20dBc

Spectrum analyser settings as specified by ANSI C63.10-2020/Cor1-2023 Clause 11.11.2

Receiver Parameters	Setting
Detector Function	Peak
Start Frequency	9KHz
Stop Frequency	10000MHz
Resolution Bandwidth	100kHz
Video Bandwidth	300kHz
Sweep rate	Auto couple
Trace mode	Max hold

9.1.3 Test Area

LAB 8

9.1.4 Tested by

L Trickett

9.1.5 Test Setup

The antenna port was connected directly to the signal analyser.

9.1.6 Test Results

The plots below demonstrate that at the band edge the power is more than 20 dB below the carrier power in the 100kHz bandwidth. Therefore, this demonstrates compliance.
