

Difference Statement

The product Sensor produced by our company is a Programmable sensor. Its internal program can be adjusted through LF tools without changing the existing frequencies of 315MHz and 433.92MHz. Without changing the signal strength, the data definition of the signal emitted by the Sensor is modified to achieve the function of one Sensor matching multiple products. The product sensors can be divided into eight models: PM01, PM02, PM03, PM04, PM05, PM06, PM07, and PM08. They have the same hardware and software, but the difference is that the location definition of the sent data can be changed.
