3. TEST ITEM AND RESULTS

3.1. Antenna requirement

Requirement

FCC CFR Title 47 Part 15 Subpart C Section 15.203:

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator, the manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

FCC CFR Title 47 Part 15 Subpart C Section 15.247(c) (1)(i):

(i) Systems operating in the 2400~2483.5 MHz band that is used exclusively for fixed. Point-to-point operations may employ transmitting antennas with directional gain greater than 6dBi provided the maximum conducted output power of the intentional radiator is reduced by 1 dB for every 3 dB that the directional gain of the antenna exceeds 6dBi.

Antenna Information

The maximum gain of antenna was 5.15Bi.

Note: The antenna gain is provided by the customer , if the data provided by the customer is not accurate, Shenzhen ATA Testing Lab. Inc does not assume any responsibility.

3.2. Conducted Emission

Limit

Conducted Emission Test Limit

Frequency	Maximum RF Line Voltage (dB μ V)	
	Quasi-peak Level	Average Level
150kHz~500kHz	66 ~ 56 *	56 ~ 46 *
500kHz~5MHz	56	46
5MHz~30MHz	60	50

- (3) The limit decrease in line with the logarithm of the frequency in the range of 0.15 to 0.50MHz.

Test Configuration

Test Procedure

1. The EUT was setup according to ANSI C63.10-2020 + Cor.1-2023 requirements.
2. The EUT was placed on a platform of nominal size, 1 m by 1.5 m, raised 0.8m above the conducting ground plane. The vertical conducting plane was located 40 cm to the rear of the EUT. All other surfaces of EUT were at least 0.8m from any other grounded conducting surface.
3. The EUT and simulators are connected to the main power through a line impedances stabilization network (LISN). The LISN provides a 50ohm /50uH coupling impedance for the measuring equipment. The peripheral devices are also connected to the main power through a LISN. (Please refer to the block diagram of the test setup and photographs)
4. Each current-carrying conductor of the EUT power cord, except the ground (safety) conductor, was individually connected through a LISN to the input power source.
5. The excess length of the power cord between the EUT and the LISN receptacle were folded back and forth at the center of the lead to form a bundle not exceeding 40 cm in length.
6. Conducted Emissions were investigated over the frequency range from 0.15MHz to 30MHz using a receiver bandwidth of 9 kHz.
7. During the above scans, the emissions were maximized by cable manipulation.

3.3. Maximum Output Power

Limit

The maximum radiated power shall not exceed the following values:

- (1) In the bands allocated and assigned for broadcast television and in the 600 MHz service band: 50 mW EIRP
- (2) In the 600 MHz guard band and the 600 MHz duplex gap: 20 mW EIRP.

Test Procedure

1. EUT was placed on a 1.5 meter high non-conductive stand at a 3 meter test distance from the receive1.antenna. A receiving antenna was placed on the antenna mast 3 meters from the EUT for emissionmeasurements. The height of receiving antenna is 1.5m. Detected emissions were maximized at eachfrequency by rotating the EUT through 360° and adjusting the receiving antenna polarization. The radiatedemission measurements of all test transmit frequencies were measured with peak detector.
2. A log-periodic antenna or double-ridged waveguide horn antenna shall be substituted in place of the EUT.The log-periodic antenna will be driven by a signal generator and the level will be adjusted till the samepower value on the spectrum analyzer or receiver, The level of the spurious emissions can be calculatedthrough the level of the signal generator, cable loss, the gain of the substitution antenna and the readingof the spectrum analyzer or receiver.
Note: the channel found to contain the maximum PSD level can be used to establish the reference level.
3. The EUT is then put into continuously transmitting mode at its maximum power level during the test,SetTest Receiver or Spectrum RBW=1MHz,VBW=3MHz, And the maximum value of the receiver should berecorded as (Pr).
4. The EUT shall be replaced by a substitution antenna. In the chamber, an substitution antenna for thefrequency band of interest is placed at the reference point of the chamber. An RF Signal source for thefrequency band of interest is connected to the substitution antenna with a cable that has been constructedto not interfere with the radiation pattern of the antenna. A power (PMee) is applied to the input of thesubstitution antenna, and adjust the level of the signal generator output until the value of the receiverreach the previously recorded (P). The power of signal source (PMea) is recorded. The test should beperformed by rotating the test item and adiusting the receiving antenna polarization,
5. An amplifier may be connected to the Signal Source output port. And the cable should be connectbetween the Amplifier and the Substitution Antenna, The cable loss (Pa),the Substitution Antenna Gain(Ga) and the Amplifier Gain (PAg) should be recorded after test.The measurement results are obtained as described below:Power(EIRP)=PMea+PAg -Pal + Ga
6. The input level to the substitution antenna shall be recorded as power level in dBm, correctedfor any change of input attenuator setting of the measuring receiver.
7. The measurement shall be repeated with the test antenna and the substitution antenna oriented for horizontal polarization.

(Conduction)

The RF output of the transceiver was connected to the input of the Power sensor through a sufficient attenuation.

 4. The table was rotated from 0 to 360 degree to search the highest radiated emission.
 5. Repeat step 3 to 4 for each polarization and test channel to find the worst emission level.
- The results obtained are compared to the limits in order to prove compliance with the requirement.
