Test Notes

- The average EIRP reported below is calculated per 5.2.7 of ANSI C63.26-2015 which states:

The measured e.i.r.p is converted to E-field in V/m. Then the distance correction is applied before converted back to calculated e.i.r.p.as explained in KDB 971168 D01 D01 v03r01.

Effective Isotropic Radiated Power Sample Calculation

Field Strength [dBμV/m] = Measured Value [dBm] + AFCL [dB/m] + 107

$$= -85.42 \text{ dBm} + (23.34 \text{ dBm}) + 107 = 47.61 \text{ dBμV/m}$$

e.i.r.p. [dBm] = E[dB μV/m] + 20 log₁₀(d[m]) - 104.8

$$= 47.61 + (20 \cdot \log(3)) - 104.8$$

$$= -46.85 \text{ dBm e.i.r.p.}$$

*AFCL (dB/m) contains measurement antenna factor(dB/m) and cable loss(dB) as below:

Frequency [MHz]	Antenna Factor (dB/m)	Chamber measurement cable loss + amplifier [dB]	AFCL (dB/m)
992.19	23.34	2.69	26.03
17992.98	47.74	-23.84	23.90

Table 8-72. Adopted AFCL value in the calculation

- The EUT was tested in both horizontal and vertical antenna polarizations and in all possible test configurations and positioning. The worst case emissions are reported with the EUT positioning, modulations, channel bandwidth configurations shown in the tables below.
- The spectrum is measured from 30 MHz to the 10th harmonic of the fundamental frequency of the transmitter. The worst-case emissions are reported.
- Emissions below 18GHz were measured at a 3 meter test distance while emissions above 18GHz were measured at a 1 meter test distance with the application of a distance correction factor.
- Spurious emissions were measured with all EUT antennas transmitting simultaneously and all antenna ports terminated
- The "-" shown in the following RSE tables are used to denote a noise floor measurement.

8.10 Frequency Stability

§ 2.1055

Test Overview and Limit

Frequency stability testing is performed in accordance with the guidelines of KDB 971168 D01 v03r01. The frequency stability of the transmitter is measured by:

- Temperature:** The temperature is varied from -30°C, +20°C and +50°C using an environmental chamber.
- Primary Supply Voltage:** The primary supply voltage is varied from 85% to 115% of the nominal value for DC powered equipment.

Test Description

- The carrier frequency of the transmitter is measured at room temperature (20°C to provide a reference).
- The equipment is turned on in a “standby” condition for fifteen minutes before applying power to the transmitter. Measurement of the carrier frequency of the transmitter is made within one minute after applying power to the transmitter.
- Frequency measurements are made -30°C, +20°C and +50°C. A period of at least one half-hour is provided to allow stabilization of the equipment at each temperature level.

Limit

The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

Test Setup

The EUT was connected via an RF cable to a spectrum analyzer with the EUT placed inside an environmental chamber.

Figure 8-10. Test Instrument & Measurement Setup

Test Notes

None.

10.0 APPENDIX. A

10.1 Conducted Average Output Power (EIRP)

Test Overview

A transmitter port of EUT is connected to the input of a signal analyzer. All measurements are performed as RMS average measurements while the EUT is operating at its maximum duty cycle, at maximum power, and at the appropriate frequencies.

Test Description

KDB 971168 D01 v03r01 – Section 5.4

KDB 662911 D01 v02r01 – Section E)1) In-Band Power Measurements

ANSI C63.26-2015 – Section 5.2.4

ANSI C63.26 - Section 5.2.5

The measurement was made using a direct connection between the RF output of the EUT and the spectrum analyzer. The spectrum analyzer settings were as follows:

1. Conducted power measurements are performed using the signal analyzer's "channel power" measurement capability for signals with continuous operation.
2. RBW = 1 ~ 5% of the expected OBW
3. VBW $\geq 3 \times$ RBW
4. Span = 2 ~ 3 x OBW
5. No. of sweep points $\geq 2 \times$ span / RBW
6. Detector = RMS
7. Trigger Settings is set to "RF Power" for signals with non-continuous operation with the sweep times set to "auto". Refer test note 3 for details.
8. Trace mode = Trace-Averaging (RMS) set to average over 100 sweeps
9. The trace was allowed to stabilize

Test Setup

The EUT and measurement equipment were set up as shown in the diagram below.

Figure 10-1. Test Instrument & Measurement Setup

Limit

Test Report S/N: 8K21101307-R3.A3L	Test Dates: 10/15/2021 – 03/04/2022	EUT Type: RRU(RT4401)		Page 165 of 175

Note

- Conducted Average Output Power test result used to Grant of Authorization power and MPE.
- Periodic trigger was used with gating ON. Gate sweep time, Gate delay and gate length were set accordingly to capture ON time of the transmission.
- MIMO Calculations are done considering output channel power for all ports and respective margins are calculated according to procedures in section 6.4 of ANSI C63.26 and section D of KDB 971168 D01 v03r01.
- Consider the following factors for MIMO Power:
 Conducted power for each port is measured in dBm.
 Powers are summed up in linear using the measure-and-sum technique defined in KDB 971168 D01 v03r01-Section D.
 Conducted power per port (dBm) is converted to a linear value (mW). A summation of linear powers for all ports gives us the total MIMO conducted power in milliwatts (mW).
- The EUT have multiple antennas transmitting correlated signals with the equal antenna gains and two outputs driving a cross-polarized antennas with $N_{ANT}=2$.
 Directional gain is to be computed as follows;
 * Directional gain = $G_{ANT} + 10 \log(N_{ANT})$ dBi
- Worst e.i.r.p Case Scenario gain antenna was selected to perform all RF testing that can get maximum power setting. And High gain antenna power setting will be reduced according to difference value of antenna gain declared by applicant.
- Applied antenna gain as below:

Bandwidth	Antenna gain (dBi)	Directional gain (dBi)
All Bandwidth	8.5	11.5

- Sample Calculation:
 Let us assume the following numbers:
 e) Total MIMO Conducted Power as 2597.54 mW
 f) Antenna Gain = 11.50 dBi

Factors	Value	Unit
Summed MIMO Conducted Power (linear sum)	2597.54	mW
Summed MIMO Conducted Power (dBm) = $10 * \log(2597.54) =$	34.15	dBm/10MHz
Antenna Gain	11.50	dBi
Total MIMO EIRP	45.65	dBm/10MHz
