3-1 Frequency Synthesizer Circuit

The Frequency synthesizer is an indirect frequency synthesizer PLL(Phased Locked Loop). It consists of a VCTCXO(U305), PLL IC(U306), VCO(U307) and loop filter.

VCTCXO

The VCTCXO(U305) is a reference source of the frequency synthesizer. It provides 19.68MHz reference frequency to PLL. The VCTCXO is a Voltage Controlled Temperature Compensated Crystal Oscillator having 19.68MHz $\pm$ 2.5ppm frequency stability over all useful temperature range.

A correct frequency tuning is made by the voltage control.

VCO

The VCO(U307) generates the signal having 966 $\pm$ 12.5MHz center frequency with the voltage control. PLL IC controls this signal.

PLL IC

The PLL IC(U306) includes prescalers and charge pump. The reference divider in PLL IC divides the frequency of VCTCXO by 656 and makes reference frequency to 30KHz.

This reference frequency is supplied to one of the input of phase detector. The signal generated at VCO goes into another input stage of the phase detector through a prescaler and the main divider. At this point, the error proportional to the phase difference of two inputs is occurred. This error signal is supplied to the frequency control input stage of VCO through the loop filter composed of RC.

3-2 Spurious Radiation Suppression Circuit

The spurious signal from antenna is suppressed at the duplexer. The duplexer has a flat characteristics to the receive signal and a high attenuation characteristics to the harmonic signals of transmission. So, it suppress the spurious radiation
