## 7.5 Radiated Spurious and Harmonic Emissions

**§2.1051 §30.203**

### **Test Overview**

Out of band emissions were scanned from 30MHz to 100GHz in a radiated test setup with the EUT operating at maximum duty cycle and power. Spurious emission plots were obtained for Low, Mid, and High operating channels. All modulations and applicable CC settings were investigated to determine worst case condition.

***The conductive power or total radiated power of any emissions outside a licensee's frequency block shall be -13dBm/1MHz.***

### **Test Procedure Used**

ANSI C63.26-2015 Section 5.7.4

ANSI C63.26-2015 Section 6.4

### **Test Settings**

1. Start frequency was set to 30MHz and stop frequency was set to 100 GHz. Several plots are used to show investigations in this entire span.
2. Detector = RMS
3. Trace mode = trace average
4. Sweep time = auto couple
5. Number of sweep points  $\geq 2 \times \text{Span/RBW}$
6. The trace was allowed to stabilize
7. RBW = 1MHz, VBW = 1MHz

### **Test Notes**

- 1) The EUT was tested while positioned upright and mounted on a mast 1.5m height. The worst case emissions are reported with the EUT in this fixed position and with the modulations and active component carriers shown in the tables below.
- 2) Emissions below 18GHz were measured at a 3 meter test distance, while emissions above 18GHz were measured at the appropriate far field distance. See Table 3-1 for distances used for measurements based on theoretical far field distance.
- 3) All appropriate Antenna Factors, Cable Losses, and Mixer Conversion Losses have been applied as an offset in the spectrum analyzer for each measurement.
- 4) 1CC = 1 Components Carriers Active, 8CC = 8 Component Carriers Active. Each component carrier's bandwidth is 100MHz.
- 5) The angle of the horn antenna was rotated to maximize and find the worst case emissions. The worst case is reported in this section.
- 6) Spurious emissions were measured with all EUT antennas transmitting simultaneously.
- 7) All out-of-band spurious emission measurements are recorded as EIRP values. TRP or conducted measurements were not needed for this spurious emission evaluation since the measured EIRP levels were all compliant with the §30.203 limits.

**Table 7-17. Spurious Emissions (30MHz – 1GHz)**

## Spurious Emissions EIRP Sample Calculation

The raw radiated spurious level is converted to field strength in dBμV/m. Then, the RSE EIRP level is calculated by applying the additional factors shown below for a test distance of 3 meters.

$$\begin{aligned}
 \text{Spurious Level [dBμV/m]} &= \text{Analyzer Level [dBm]} + \text{AFCL [dB/m]} + 107 \\
 &= -56.01 \text{ dBm} - 22.64 \text{ dB/m} + 107 \\
 &= 28.35 \text{ dBμV/m}
 \end{aligned}$$

$$\begin{aligned}
 \text{RSE EIRP [dBm]} &= \text{Field Strength} + 20\text{Log}(D_m) - 104.8 \\
 &= 28.35 \text{ dBμV/m} + 20\text{Log}(3) - 104.8 \\
 &= -95.06 \text{ dBm}
 \end{aligned}$$

**Table 7-18. Spurious Emissions (1 – 18GHz)**

**Note:**

The investigated emissions of 5.10-5.66 GHz are that of a local oscillator of the EUT. The harmonics of the local oscillator are investigated as well and provided in the table.

**Spurious Emissions EIRP Sample Calculation**

The raw radiated spurious level is converted to field strength in dBμV/m. Then, the RSE EIRP level is calculated by applying the additional factors shown below for a test distance of 3 meters.

$$\text{RSE EIRP [dBm]} = \text{Analyzer Level [dBm]} + \text{AFCL [dB/m]} + 107 + 20\text{Log}(D_m) - 104.8$$

|                                            |                                                                                     |                                       |                                                                                       |                                 |

**Table 7-19. Spurious Emissions (18 – 26.5GHz)**

## Spurious Emissions EIRP Sample Calculation

The raw radiated spurious level is converted to field strength in dBμV/m. Then, the RSE EIRP level is calculated by applying the additional factors shown below for a test distance of 2.16 meters.

$$\text{RSE EIRP [dBm]} = \text{Analyzer Level [dBm]} + \text{AFCL [dB/m]} + 107 + 20\text{Log}(D_m) - 104.8$$

|                                            |                                                                                     |                                       |                                                                                       |                                 |

## 7.5.4 Radiated Spurious Emissions Plots (26.5 – 40GHz)

Note: The spurious emissions scans started at 29GHz as shown in the plots of this section so as to only focus on the spurious emissions and not the fundamental emission.

Table 7-20. Spurious Emissions (26.5 – 40GHz)

## Spurious Emissions EIRP Sample Calculation

The raw radiated spurious level is converted to field strength in dBμV/m. Then, the RSE EIRP level is calculated by applying the additional factors shown below for a test distance of 2.16 meters.

$$\text{RSE EIRP [dBm]} = \text{Analyzer Level [dBm]} + \text{AFCL [dB/m]} + 107 + 20\text{Log}(D_m) - 104.8$$

|                                            |                                               |                                              |                |                                 |

**Table 7-23. Spurious Emissions (90 – 100GHz)**

### **Note**

The RSE EIRP level is taken directly from the spectrum analyzer which includes the appropriate antenna factors, cable losses, and harmonic mixer conversion losses. Measurements were performed at a distance of 5.41 meters.

## 7.6 Band Edge Emissions

### §2.1051 §30.203

#### Test Overview

All out of band emissions are measured in a radiated setup while the EUT is operating at its maximum duty cycle, at maximum power, and at the appropriate frequencies. All modulations were investigated to determine the worst case configuration. All modes of operation were investigated and the worst case configuration results are reported in this section.

***The minimum permissible attenuation level of any spurious emission is -13dBm/1MHz. However, in the bands immediately outside and adjacent to the licensee's frequency block, having a bandwidth equal to 10 percent of the channel bandwidth, the conductive power or the total radiated power of any emission shall be -5 dBm/MHz or lower.***

#### Test Procedure Used

ANSI C63.26-2015 Section 5.7.3  
ANSI C63.26-2015 Section 6.4

#### Test Settings

1. Start and stop frequency were set such that both upper and lower band edges are measured.
2. Span was set large enough so as to capture all out of band emissions near the band edge
3. RBW = 1MHz
4. VBW  $\geq 3 \times$  RBW
5. Detector = RMS
6. Number of sweep points  $\geq 2 \times$  Span/RBW
7. Trace mode = trace average
8. Sweep time = auto couple
9. The trace was allowed to stabilize

#### Test Notes

- 1) The EUT was tested while positioned upright and mounted on a mast 1.5m height. The worst case emissions are reported with the EUT in this fixed position and with the modulations and active component carriers shown in the tables below.
- 2) All measurements in this section was performed in the radiated setup in the far field.
- 3) All appropriate Antenna Factor and Cable Loss have been applied in the spectrum analyzer for each measurement. Additionally, band Edge measurements in this section are shown as equivalent conductive powers for direct comparison to the 30.203 limit. The conductive power at the band edge is calculated by subtracting the gain of the EUT's antenna from the measured EIRP level. Antenna Gain information is shown on the following page.
- 4) 1CC = 1 Component Carrier Active, and 8CC = 8 Component Carriers Active. Each component carrier's bandwidth is 100MHz.

- 5) For band edge measurement of EUT's Antenna A, the receive horn antenna was maximized on Antenna A and then the other antennas (B, C, and D) were individually energized and measured while maintaining maximized position on Antenna A. These measurements were saved into a spreadsheet and their spectra were summed to determine the total conducted power for the band edge emissions level shown starting in Section 7.6.5. The same procedure was repeated with the receive horn antenna maximized on Antennas B, C, and D.
- 6) The MIMO Band Edges were calculated by using the "measure and sum the spectra across the outputs" technique specified in Section 6.4.3.2.2 of ANSI C63.26-2015. The spectra were summed linearly and converted to dBm for comparison with the limit.
