7.1. RF OUTPUT POWER

TEST PROCEDURE

ANSI C63.26:2015/ TIA / EIA 603-E
KDB 940660 Section 2.b.1

$$\text{ERP/EIRP} = \text{PMeas} + \text{GT} - \text{LC}$$

where: ERP/EIRP = effective or equivalent radiated power, respectively (expressed in the same units as PMeas, typically dBW or dBm);

PMeas = measured transmitter output power or PSD, in dBm or dBW;

GT = gain of the transmitting antenna, in dBd (ERP) or dBi (EIRP);

LC = signal attenuation in the connecting cable between the transmitter and antenna, in dB.

For devices utilizing multiple antennas, KDB 662911 provides guidance for determining the effective array transmit antenna gain term to be used in the above equation.

LIMITS

b) Power limits. Unless otherwise specified in this section, the maximum effective isotropic radiated power (EIRP) and maximum Power Spectral Density (PSD) of any CBSD and End User Device must comply with the limits shown in the table below.

Device	Maximum EIRP (dBm/10 megahertz)	Maximum PSD (dBm/MHz)
End User Device	23	n/a
Category A CBSD	30	20
Category B CBSD ¹	47	37

MODES TESTED

LTE Band 48

- QPSK
- 16QAM
- 64QAM

The TX chains are correlated and the antenna gain is the same for each chain. The directional gain is:

OMNI ANTENNA AB

Antenna Gain (dBi)	10 * Log (2 chains) (dB)	Correlated Chains Directional Gain (dBi)
3.00	3.01	6.01

OMNI ANTENNA CD

Antenna Gain (dBi)	10 * Log (2 chains) (dB)	Correlated Chains Directional Gain (dBi)
3.00	3.01	6.01

DIRECTIONAL ANTENNA AB

Antenna Gain (dBi)	10 * Log (2 chains) (dB)	Correlated Chains Directional Gain (dBi)
7.00	3.01	10.01

DIRECTIONAL ANTENNA CD

Antenna Gain (dBi)	10 * Log (2 chains) (dB)	Correlated Chains Directional Gain (dBi)
7.00	3.01	10.01

NOTE: Due to limited modulation bandwidth and limited display capabilities of spectrum analyzer (Maximum up to 8MHz RBW) an alternative procedure was used as shown below to calculate RF output power based on PSD (Section 7.4) results to comply with dBm/10MHz power limit:

- $PSD + 10\log(10) = \text{RF output power}$

Note: Total power was only aggregated across on each individual MIMO transmitter A+B or C+D per 10MHz bandwidth.

7.1.1. LTE OUTPUT POWER RESULT FOR OMNI ANTENNA

The transmitter has a maximum Average conducted power and EIRP output power per 10MHz as follows:

7.2. PEAK TO AVERAGE RATIO

TEST PROCEDURE

Per KDB 940660 D0R1

TEST SPEC

Some regulatory requirements specify a PAPR limit when the output power limits are specified in terms of average power. If it becomes necessary to provide measurement data to demonstrate compliance to a PAPR limit, then the appropriate procedure from those provided in 5.2.3 shall be utilized to determine the peak power (or peak PSD) and the appropriate procedure from those provided in 5.2.4 shall be used to determine the average power (or average PSD). The data from these measurements is then used in Equation (2) to determine the PAPR of a narrowband CW-like signal. See 5.2.3.4 for guidance on determining the PAPR of a broadband noise-like signal.

$$\text{PAPR (dB)} = P_{\text{pk}} \text{ (dBm or dBW)} - P_{\text{Avg}} \text{ (dBm or dBW)} \quad (2)$$

where

PAPR peak-to-average power ratio, in dB
 P_{pk} measured peak power or peak PSD level, in dBm or dBW
 P_{Avg} measured average power or average PSD level, in dBm or dBW

7.3. OCCUPIED BANDWIDTH

RULE PART(S)

FCC: §2.1049

LIMITS

For reporting purposes only

TEST PROCEDURE

The transmitter output was connected to a calibrated coaxial cable and coupler, the other end of which was connected to a spectrum analyzer. The occupied bandwidth was measured with the spectrum analyzer at the low, middle and high channel in each band. The -26dB bandwidth was also measured and recorded.
