B7.0 Operating Band-Edge Measurements – RF Conducted

Rule Part:

15.247(d)

Test Procedure:

ANSI C63.10-2013
11.11 Emissions in non-restricted frequency bands
11.11.2 Reference Level Measurement
11.11.3 Unwanted Emissions Level Measurement

Limit:

The peak conducted output power measured within any 100 kHz outside the authorized frequency band shall be attenuated by at least 20 dB relative to the maximum measured in-band peak PSD level.

Results:

Compliant

Notes:

The EUT has 2 on-board antennas and one external antenna port of which only one can operate at a time. Initial output power measurements indicate the highest power levels occurred from the external antenna port. Measurements were performed on this port to represent worst-case emissions. Testing was performed using the manufacturer's test software with output power setting 14 and with modulation and data rate set to 802.11-n, MCS7 (widest signal; worst-case). The EUT was tested at the lowest, and highest channels of operation. The spectrum analyzer measurements were corrected to account for the cable loss and external attenuator.

Test Date: 03-16-2017
Company: Whirlpool Corporation
EUT: Tourmaline
Test: Emissions in non-restricted frequency bands
RF conducted band-edge emission
Operator: Craig B

Antenna: External Antenna Port
Channel: Low, 2412 MHz
Modulation: 802.11-n, MCS7
Power setting: 14

Limit: Band-Edge > 20 dB Below Peak In-Band Emission

Band-Edge Frequency = 2.4 GHz

Appendix B

B8.0 Restricted Band-Edge Measurements – Radiated

Measured at nearest restricted bands

Rule Part:

15.247(d), 15.205(a), 15.209(a)

Test Procedure:

ANSI C63.10-2013
11.12 Emissions in Restricted Frequency Bands
11.12.1 Radiated Emissions Measurements

Limit:

15.209(a)

Results:

Compliant

Notes:

Measurements were performed while the EUT was transmitting from on-board antenna number 1. Testing was then repeated with the EUT transmitting from on-board antenna number 2. Testing was then repeated with the EUT transmitting from the external antenna port with the PIFA and F antennas. Testing was performed with all modulation types using the data rate that produced the widest signal. The EUT was tested at various channels of operation. The highest output power setting that resulted in a passing condition is noted on the data. Measurements were performed at the 2.39 GHz and 2.4835 GHz restricted band edges.
