GENERAL REPORT SUMMARY

This electromagnetic emission test report is generated by Compatible Electronics Inc., which is an independent testing and consulting firm. The test report is based on testing performed by Compatible Electronics personnel according to the measurement procedures described in the test specifications given below and in the "Test Procedures" section of this report.

The measurement data and conclusions appearing herein relate only to the sample tested and this report may not be reproduced in any form unless done so in full with the written permission of Compatible Electronics.

This report must not be used to claim product endorsement by NVLAP or any other agency of the U.S. Government.

Device Tested: 2.4 GHz / 900 MHz Cordless Phone
Model: TC-2775L
S/N: N/A

Modifications: The EUT was modified during the testing. Please see Appendix A.

Manufacturer: Casio Communications, Inc.
P.O. Box 2914
Torrance, California 90509-9214

Test Date: April 28, May 1 and June 6, 2000

Test Specifications: EMI requirements
FCC Title 47, Part 15 Subpart B; and Subpart C, sections 15.205, 15.207, 15.209, and 15.249

Test Procedure: ANSI C63.4: 1992

Test Deviations: The test procedure was not deviated from during the testing.

SUMMARY OF TEST RESULTS

TEST	DESCRIPTION	RESULTS
1	Conducted RF Emissions, 450 kHz - 30 MHz	Complies with the limits of CFR Title 47, Part 15, Subpart C, section 15.207
2	Radiated RF Emissions, 10 kHz - 25000 MHz	Complies with the limits of CFR Title 47, Part 15, Subpart C, sections 15.205 and 15.249

1. PURPOSE

This document is a qualification test report based on the Electromagnetic Compatibility (EMC) tests performed on the 2.4 GHz / 900 MHz Cordless Phone Model: TC-2775L. The EMI measurements were performed according to the measurement procedure described in ANSI C63.4: 1992. The tests were performed in order to determine whether the electromagnetic emissions from the equipment under test, referred to as EUT hereafter, are within the specification limits defined by CFR Title 47, Part 15, Subpart B; and Subpart C, sections 15.205, 15.207, and 15.249.

2. ADMINISTRATIVE DATA

2.1 Location of Testing

The EMI tests described herein were performed at the test facility of Compatible Electronics, 114 Olinda Drive, Brea, California 92823.

2.2 Traceability Statement

The calibration certificates of all test equipment used during the test are on file at the location of the test. The calibration is traceable to the National Institute of Standards and Technology (NIST).

2.3 Cognizant Personnel

Casio Communications, Inc.

Lananh T. Tran Compliance Engineer

Compatible Electronics Inc.

Kyle Fujimoto Test Engineer

Scott McCutchan Lab Manager

2.4 Date Test Sample was Received

The test sample was received on April 28, 2000.

2.5 Disposition of the Test Sample

The test sample has not yet been returned to Casio Communications, Inc.

2.6 Abbreviations and Acronyms

The following abbreviations and acronyms may be used in this document.

RF	Radio Frequency
EMI	Electromagnetic Interference
EUT	Equipment Under Test
P/N	Part Number
S/N	Serial Number
HP	Hewlett Packard
ITE	Information Technology Equipment
CML	Corrected Meter Limit
LISN	Line Impedance Stabilization Network
NCR	No Calibration Required
H/S	Handset Station
B/S	Base Station

3. APPLICABLE DOCUMENTS

The following documents are referenced or used in the preparation of this EMC Test Report.

SPEC	TITLE
FCC Title 47, Part 15 Subpart C	FCC Rules - Radio frequency devices (including digital devices) – Intentional Radiators.
ANSI C63.4 1992	Methods of measurement of radio-noise emissions from low-voltage electrical and electronic equipment in the range of 9 kHz to 40 GHz.
FCC Title 47, Part 15 Subpart B	FCC Rules - Radio frequency devices (including digital devices) – Unintentional Radiators.

4. DESCRIPTION OF TEST CONFIGURATION

4.1 Description of Test Configuration - EMI

Specifics of the EUT and Peripherals Tested

Handset being tested: The 2.4 GHz / 900 MHz Cordless Phone - Handset Model: TC-2775L (EUT) was connected to a headset via its headset port. The handset was placed on the wooden table and tested in three orthogonal axis. The low (channel 1), medium (channel 30), and high (channel 60) channels were tested. The handset was transmitting to and receiving from the base unit. The EUT was investigated for emissions while off hook. The radiated data was taken in this mode of operation. All initial investigations were performed with the EMI receiver in manual mode scanning the frequency range continuously. The cables were bundled and routed as shown in the photographs in Appendix C. **The final radiated data was taken in the Y axis, which was the orthogonal axis that produced the highest emissions during the initial investigation.**

Base being tested: The 2.4 GHz / 900 MHz Cordless Phone - Base Model: TC-2775L (EUT) was placed on the wooden table. The low (channel 1), medium (channel 30), and high (channel 60) channels were tested. The base was connected to two different line simulators and an AC adapter via its line and power ports, respectively. The first line simulator was also connected to the Northern Telecom telephone. The second line simulator was also connected to the Conair telephone. The base was transmitting and receiving from the handset. The handset was also used to dial out a number on the first line simulator that caused the Northern Telecom telephone to ring. The Northern Telecom telephone was then taken off hook to allow for normal communications between the base unit and handset. The Conair telephone was used to dial out a number on the second line simulator to the EUT's second line. The conducted as well as radiated data was taken in this mode of operation. All initial investigations were performed with the EMI receiver in manual mode scanning the frequency range continuously. The cables were bundled and routed as shown in the photographs in Appendix C. **The final radiated as well as conducted data was taken in the X axis, which was the orthogonal axis that produced the highest emissions during the initial investigation.**

4.1.1 Cable Construction and Termination

Cable 1

This is a 6 foot unshielded cable connecting the EUT to test line simulator #1. It has an RJ-11 connector at each end. The cable was bundled to a length of 1 meter.

Cable 2

This is a 6 foot unshielded cable connecting the Northern Telecom phone to test line simulator #1. It has an RJ-11 connector at each end. The cable was bundled to a length of 1 meter.

Cable 3

This is a 6 foot unshielded cable connecting the EUT to test line simulator #2. It has an RJ-11 connector at each end. The cable was bundled to a length of 1 meter.

Cable 4

This is a 6 foot unshielded cable connecting the Conair phone to test line simulator #2. It has an RJ-11 connector at each end. The cable was bundled to a length of 1 meter.

Cable 5

This is a 6 foot unshielded cable connecting the base to the AC Adapter. It has a 1/8 inch power connector at the base end and is hard wired into the AC Adapter.

5. LISTS OF EUT, ACCESSORIES AND TEST EQUIPMENT

5.1 EUT and Accessory List

EQUIPMENT	MANUFACTURER	MODEL NUMBER	SERIAL NUMBER	FCC ID

6. TEST SITE DESCRIPTION

6.1 Test Facility Description

Please refer to section 2.1 and 7.1.2 of this report for EMI test location.

6.2 EUT Mounting, Bonding and Grounding

The EUT was mounted on a 1.0 by 1.5 meter non-conductive table 0.8 meters above the ground plane.

The EUT was not grounded.

7. TEST PROCEDURES

The following sections describe the test methods and the specifications for the tests. Test results are also included in this section.

7.1 RF Emissions

7.1.1 Conducted Emissions Test

The spectrum analyzer was used as a measuring meter along with the quasi-peak adapter. The data was collected with the spectrum analyzer in the peak detect mode with the "Max Hold" feature activated. The quasi-peak detector was used only where indicated in the data sheets. A 10 dB attenuation pad was used for the protection of the spectrum analyzer input stage, and the spectrum analyzer offset was adjusted accordingly to read the actual data measured. The LISN output was read by the spectrum analyzer. The output of the second LISN was terminated by a 50 ohm termination. The effective measurement bandwidth used for the conducted emissions test was 9 kHz.

Please see section 6.2 of this report for mounting, bonding and grounding of the EUT. The EUT was powered through the LISN, which was bonded to the ground plane. The LISN power was filtered and the filter was bonded to the ground plane. The EUT was set up with the minimum distances from any conductive surfaces as specified in ANSI C63.4: 1992. The excess power cord was wrapped in a figure eight pattern to form a bundle not exceeding 0.4 meters in length.

The initial test data was taken in manual mode while scanning the frequency ranges of 0.45 MHz to 1.6 MHz, 1.6 MHz to 5 MHz and 5 MHz to 30 MHz. The conducted emissions from the EUT were maximized for operating mode as well as cable placement. Once a predominant frequency (within 12 dB of the limit) was found, it was more closely examined with the spectrum analyzer span adjusted to 1 MHz.

The final data was collected under program control by the HP 9000/300 in several overlapping sweeps by running the spectrum analyzer at a minimum scan rate of 10 seconds per octave.

7.1.2 Radiated Emissions (Spurious and Harmonics) Test

The spectrum analyzer was used as a measuring meter along with the quasi-peak adapter. Amplifiers were used to increase the sensitivity of the instrument. The Com Power Preamplifier Model: PA-102 was used for frequencies from 30 MHz to 1 GHz, and the Com-Power Microwave Amplifier Model: PA-122 was used for frequencies above 1 GHz. The spectrum analyzer was used in the peak detect mode with the "Max Hold" feature activated. In this mode, the spectrum analyzer records the highest measured reading over all the sweeps. The quasi-peak adapter was used only for those readings which are marked accordingly on the data sheets. The measurement bandwidths and transducers used for the radiated emissions test were:

FREQUENCY RANGE	EFFECTIVE MEASUREMENT BANDWIDTH	TRANSDUCER
10 kHz to 150 kHz	200 Hz	Active Loop Antenna
150 kHz to 30 MHz	9 kHz	Active Loop Antenna
30 MHz to 300 MHz	120 kHz	Biconical Antenna
300 MHz to 1 GHz	120 kHz	Log Periodic Antenna
1 GHz to 25 GHz	1 MHz	Horn Antenna

The open field test site of Compatible Electronics, Inc. was used for radiated emission testing. This test site is set up according to ANSI C63.4: 1992. Please see section 6.2 of this report for mounting, bonding and grounding of the EUT. The turntable supporting the EUT is remote controlled using a motor. The turntable permits EUT rotation of 360 degrees in order to maximize emissions. Also, the antenna mast allows height variation of the antenna from 1 meter to 4 meters. Data was collected in the worst case (highest emission) configuration of the EUT. At each reading, the EUT was rotated 360 degrees and the antenna height was varied from 1 to 4 meters (for E field radiated field strength). The gunsight method was used when measuring with the horn antenna in order to ensure accurate results.

Radiated Emissions (Spurious and Harmonics) Test (con't)

The presence of ambient signals was verified by turning the EUT off. In case an ambient signal was detected, the measurement bandwidth was reduced temporarily and verification was made that an additional adjacent peak did not exist. This ensures that the ambient signal does not hide any emissions from the EUT. The EUT was tested at a 3 meter test distance to obtain final test data.

For the 22 GHz – 25 GHz span, the Hewlett Packard 11970K Harmonic Mixer and the Hewlett Packard 11975A Amplifier were used to allow the spectrum analyzer to scan up to 25 GHz.

7.2 RF Band Edges

The RF band edges were taken at the edges of the ISM spectrum (2400 MHz when the EUT was on channel 1 and 2483.50 MHz when the EUT was on channel 60 for the base and 902 MHz when the EUT was on channel 1 and 928 MHz when the EUT was on channel 60 for the handset) using the spectrum analyzer. The RF band edges were measured at 3 meters using a preamplifier to easier see any emissions near the band edges. Both the handset and base were tested. A spectral plot of the band edges are included to prove the emissions at the band edges were below the requirements of 15.249 (c).

8. CONCLUSIONS

The 2.4 GHz / 900 MHz Cordless Phone Model: TC-2775L meets all of the specification limits defined in FCC Title 47, Part 15, Subpart B; and Subpart C, sections 15.205, 15.207, 15.209, and 15.249.

APPENDIX A

MODIFICATIONS TO THE EUT

MODIFICATIONS TO THE EUT

The modifications listed below were made to the EUT to pass FCC Subpart B specifications.

All the rework described below was implemented during the test in a method that could be reproduced in all the units by the manufacturer.

1) Added copper tape to the existing shield to close the gap between the shield and the PCB. Please see photograph on next page.

MODIFICATION #1

CASIO COMMUNICATIONS, INC.

**Federal Communications Commission
Office of the Secretary
1919 M Street N. W.
Washington D.C. 20554**

SUBJECT: MODIFICATION

Applicant: Casio Communications, Inc.
Model Numbers: TC-2775L, TC-2775 and TC-2270
FCC ID: AAL-CP-2775

This is to advise that we had installed a shield plate on the PCB next to the ribbon cable of the base unit. This modification helped to meet the requirement of FCC Rules Part 15.

Sincerely,

Casio Communications, Inc.

A handwritten signature in black ink, appearing to read "Brady Guillaume".

Brady Guillaume
Manager of Engineering

Date: 6/8/00

APPENDIX B

***ADDITIONAL MODELS COVERED
UNDER THIS REPORT***

ADDITIONAL MODELS COVERED UNDER THIS REPORT

USED FOR THE PRIMARY TEST:

2.4 GHz / 900 MHz Cordless Phone
Model: TC-2775L
S/N: N/A

ALSO APPROVED UNDER THIS REPORT:

2.4 GHz / 900 MHz Cordless Phone
Model: TC-2270
S/N: N/A

The TC-2275 is a degraded version of the model TC-2775L. The differences are that the TC-2275 has the following option removed.

1. Low Cost Routing feature

ALSO APPROVED UNDER THIS REPORT:

2.4 GHz / 900 MHz Cordless Phone
Model: TC-2775LA
S/N: N/A

The TC-2270 is a degraded version of the model TC-2775L. The differences are that the TC-2270 has the following options removed.

1. Low Cost Routing feature
2. Data Port (additional RJ-11 port)
3. No Handset-in-Use base LED

Please see the next page for the official letter by the manufacturer stating the differences mentioned above.

CASIO COMMUNICATIONS, INC.

Federal Communications Commission
Office of the Secretary
1919 M Street N. W.
Washington D.C. 20554

SUBJECT: FAMILY MODELS

Applicant: Casio Communications, Inc.
Original Model Number: TC-2775L
Modified Model Number: TC-2270 and TC-2775

This is to declare that models TC-2270 and TC-2775 is a degraded version of model TC-2775L.
They are identical to each other except that:

Model TC-2775 does not have the Low Cost Routing feature.

Model TC-2270 does not have the (1) Low Cost Routing feature, (2) Data Port - additional RJ-11 port and (3) No Handset-in-Use base LED.

Sincerely,

Casio Communications, Inc.

A handwritten signature in cursive script that reads "Kevin Mullally".

Kevin Mullally
Engineering Manager

Test location: Compatible Electronics
Customer : CASIO COMMUNICATIONS, INC. Date : 6/ 6/2000
Manufacturer : CASIO COMMUNICATIONS, INC. Time : 14.58
EUT name : 900 MHz / 2.4 GHz CORDLESS PHONE Model: TC-2775L
Specification: Fcc_B Test distance: 3.0 mtrs Lab: D
Distance correction factor($20 \cdot \log(\text{test}/\text{spec})$) : 0.00
Test Mode : HANDSET UNIT - 300 TO 1000 MHz HORIZ. AND VERT.
TEMPERATURE 88 DEGREES F.
RELATIVE HUMIDITY 35%
TESTED BY: Kyle Fujimoto
KYLE FUJIMOTO

NO EMISSIONS FOUND FROM THE HANDSET UNIT
FROM 10 kHz TO 30 MHz IN EITHER POLARIZATION
