Note;

The detailed description of measuring facility was found to be in compliance with Federal Communications Commission requirements of § 2.948 according to ANSI C63.4 on August 21, 1997.

INTRODUCTION

2. GENERAL TEST CONDITIONS

The test data contained in this report was obtained by use of the measurement method recommended in FCC Rules, 47 C.F.R. § 15.31(a)(3), with equipments and at the test site filed by the Federal Communications Commission (FCC). The technical standard for a TV interface device are set forth in Subpart B of Part 15 of FCC Rules and regulation. The measurement for Radiated Emissions, Powerline Conducted Emissions, Output signal levels, Output Terminal Conducted Spurious Emissions and Transfer Switch Isolation were performed in accordance with the procedures described in MP-3 and ANSI C63.4-1992.

2 . 1 OPERATING CONDITIONS OF THE EUT

According to the requirements in Subpart B of Part 15, the measurement is made at each function of the EUT being connected with appropriate cables and loads.

The model ~~16-430~~ has either a video/audio output terminal in RCA-type plugs and antenna input terminal .Therefore, every measurement was investigated in the operation modes, Playing VITS1Vp-p recorded tape, at each Ch. 3 or/and 4 for each mode applicable.

2 . 2 STABILIZATION OF EUT OPERATION

The EUT was operated for sufficient minutes before testing to make it stabilized in a normal operating condition. The power supplied to the EUT was filtered to meet the requirements.

2 . 3 TEMPERATURE

Measurement procedure recommended by FCC requires the test to be performed at the site with ambient temperature within 10 to 40 °C (50 to 104 °F). The specification for operating temperature of EUT is from 5 to 35 °C (41 to 95 °F) as described in owner's manual. The measurement data in this report was obtained at the temperature in the range of 15°C ~ 19°C.

INTRODUCTION

3. TEST SITE

3 . 1 OPEN AREA TEST SITE

Measurement of radiated emissions from EUT was made at open area test site, a description of which has been submitted to the FCC pursuant to Part 15 of 47 C.F.R., §2.948.

3 . 2 A SHIELDED ENCLOSURE.

All other measurements, including power line conducted emissions, output signal levels, and transfer switch isolation, and transfer switch isolation were made in a shielded enclosure providing sufficient shielding effectiveness.

4. MEASURING INSTRUMENTATIONS AND CALIBRATIONS.

Measurements of output signal level, output terminal conducted spurious emissions, and transfer switch isolation (if applicable) were made with instruments calibrated according to the recommendation by manufacturer. Measurement of radiated emissions and power line conducted emissions were made with instruments conforming to American National Standard Specification, ANSI C63.4 (1992). The calibration of measuring instrument, including any accessories that may affect test results, was performed according to the recommendation by manufactures.

5. DESCRIPTION OF TEST CONDITION.

5 . 1 POWERLINE CONDUCTED EMISSION MEASUREMENT.

5 . 1 . 1 SHIELDED ENCLOSURE.

The measurement for powerline emissions from EUT was made in shielded enclosure which provides sufficient shielding effectiveness enough not to affect test results.

5 . 1 . 2 DETECTOR FUNCTION SELECTION AND BANDWIDTH.

During conducted emission measurement, a radio noise meter (ESH-3, Rohde & Schwarz) that has a CISPR quasi-peak detector with 9 KHz IF bandwidth of 6 dB was utilized.

INTRODUCTION

5 . 1 . 3 FREQUENCY RANGE TO BE SCANNED.

For conducted emissions measurement, frequency range of 450 KHz to 30 MHz, included, was investigated.

5 . 1 . 4 UNIT OF MEASUREMENT.

Test results for conducted emissions are reported in micro-volts.

5 . 1 . 5 LINE IMPEDANCE STABILIZATION NETWORK (LISN).

A LISN with characteristics that conform to the requirements of Part 15 of FCC Rules was used for the measurement of conducted powerline radio noise; (50 micro-henries / 50 ohms). Chassis and earth-points for grounding of the LISN were earth-grounded.

5 . 1 . 6 TEST CONDITIONS AND CONFIGURATION OF EUT.

The EUT was configured and operated in all modes of operation so as to find the maximum emanation of emissions from EUT.

The EUT has designed to use the public AC lines with rated AC voltage as specified in OWNER's MANUAL of EUT and filtered to meet the requirement. AC power was supplied to the EUT through LISN with characteristics described in 5.1.5 of part I of this report.

The EUT was placed on a 1 m.× 1.5 m. 80 Cm. high wooden table which is place on the earth-grounded conducting surface larger than 2 square-meter. The vertical conducting surface was located 40 Cm to the EUT. Length of the power lead in excess of 80 Cm horizontally separating the EUT from LISN was folded back-and-forth form at the center of the power cord not exceeding 40 Cm in length.

Each type of accessory provided by manufacturer or typically used and support equipment were connected to the EUT during measurement to the typical usage and applicable as nearly as practicable.

5 . 2 RADIATED EMISSIONS MEASUREMENT.

5 . 2 . 1 TEST SITE.

Preliminary measurements were performed in the shielded enclosure to determine the emissions characteristics of the EUT. Final measurements were made in outdoors as described at 3.1 of Part I in this report.

5 . 2 . 2 DETECTOR FUNCTION SELECTION AND BANDWIDTH.

In radiated emissions measurement, a field strength meter (ESVP, Rohde & Schwarz) that has a CISPR quasi-peak detector was used. The 6 dB bandwidth of the detector of instrument is 120 KHz over frequency range of 30 to 1000 MHz. Emissions to be scanned above 1000 MHz may be detected in peak mode.

5 . 2 . 3 UNIT OF MEASUREMENT.

Test results of radiated emissions measurement are reported in micro-volts per meter at the specific distance. Using the unit of $\text{dB}\mu\text{V}$ on the test instrument, the indication unit was converted to field strength unit of $\mu\text{V}/\text{m}$ as following method;

$$F(\mu\text{V}/\text{m}) = 10^{(R + CL + AF)/20} (\mu\text{V}/\text{m})$$

here, F : Field Strength in $\mu\text{V}/\text{m}$,

R : Meter Reading Level in $\text{dB}(\mu\text{V})$,

CL : Cable Loss from antenna to meter in dB,

AF : Antenna Factor of receiving antenna in $\text{dB}/(\text{m})$

5 . 2 . 4 ANTENNAS.

Measurements were made using calibrated half-wave tuned Bi-log antenna in range of 30 to 1000 MHz that are correctable to levels obtained with a tuned dipole antenna.

For emissions above 1000MHz, horn antenna may be used.

Measurements were also made for both horizontal and vertical polarization.

The horizontal distance between the receiving antenna and the closest periphery of the EUT was 3 meters as described in 8.2.3 of ANSI C63.4-1992.

INTRODUCTION

5 . 2 . 5 FREQUENCY RANGE TO BE SCANNED.

For radiated emissions measurements, the spectrum in the range of 30 to 1000 MHz and above, if found, was investigated.

The measurement for powerline emissions from EUT was made in shielded enclosure which provides

5 . 2 . 6 TEST CONDITIONS AND CONFIGURATION OF EUT.

The EUT was configured and operated in all modes of operation so as to find the maximum emanation of emissions from EUT.

The power was furnished with rated (normal) AC 120 volts, as specified in the OWNER's MANUAL of EUT. The EUT was placed on a 80 Cm high non metallic 1 × 1.5 m table. The turn table containing the system was rotated and the antenna height was varied 4 m to find the maximum emanation of emissions from EUT.

Each type of accessory provided by manufacturer or typically used and support equipment were connected to the EUT during measurement to the typical usage and applicable as nearly as practicable.

5 . 3 OUTPUT SIGNAL MEASUREMENT.

During measurements for output signal levels as the RF-out terminal, a spectrum analyzer was used with characteristics described at 4. and 9.3 of part I in this report.

5 . 3 . 1 OUTPUT SIGNAL LEVEL MEASUREMENT.

RF-out terminal of EUT is designed to feed modulated signals to a TV broadcast receiver via coaxial cable with 75 Ω of rated output impedance.

The output voltage of video carrier frequency at the RF-output terminal of the EUT was measured at each channel (CH. 3 & 4) connecting directly to a spectrum analyzer with 50 Ω input impedance via 75-to-50 Ω matching pad. Indicated voltage on screen of measuring instrument was converted to the voltage of 75 Ω system.

INTRODUCTION

* Data conversion method.

$$V_{75}[\mu V] = 10^{(V_r + CF)/20}[\mu V]$$

here, V_{75} : Voltage at the RF-out terminal of 75 Ω in μV ,

V_r : Voltage read at analyzer with 50 Ω input-impedance in dB μV ,

CF : Conversion Factor of the matching pad in dB.

5 . 3 . 2 OUTPUT TERMINAL CONDUCTED SPURIOUS EMISSION MEASUREMENT.

Any other spectrum at RF-output terminal appearing on frequencies removed by more than 4.6 MHz below or 7.4 MHz above the video carrier frequency of EUT was searched at each channel.

To clarify the emissions emanated from RF output terminal of the EUT, RF pre-amplifier was utilized.

The gain of pre-amplifier at each frequency measured from EUT were obtained after sufficient warm-up for stabilization of gain.

* Data conversion method.

$$V_{75}[\mu V] = 10^{(V_r + CF - PG + AT)/20}[\mu V]$$

Where, V_{75} : Voltage at the RF-out terminal of 75 Ω in μV ,

V_r : Voltage read at analyzer with 50 Ω input-impedance in dB μV ,

CF : Conversion Factor of the matching pad in dB,

PG : Gain of pre-amplifier in dB,

AT : Attenuation of attenuator in dB.

5 . 4 TRANSFER SWITCH ISOLATION MEASUREMENT.

As a transfer switch was equipped with EUT as an antenna-in, measurement of isolation were made at RF-input terminal with rated input impedance.

The maximum voltage of video carrier frequency of the EUT at the antenna input (RF-in) terminal of the switch was measured for both channels.

INTRODUCTION

To clarify the emissions emanated from RF output terminal of the EUT, RF pre-amplifier was utilized.

The gain of pre-amplifier at each frequency measured from EUT were obtained after sufficient warm-up for stabilization of gain.

* DATA CONVERSION METHOD.

$$V_{75}[\mu V] = 10^{(Vr + CF - PG + AT)/20}[\mu V]$$

where, V_{75} : Voltage at the RF-out terminal of 75 Ω in μV ,

Vr : Voltage read at analyzer with 50 Ω input-impedance in dB μV ,

CF : Conversion Factor of the matching pad in dB,

PG : Gain of pre-amplifier in dB,

Anritsu, Model MG-318A : VITS 1 Vp-p, 5 Vp-p Generator.

[NOTE] 1) The list of instruments and accessories used the measurements are attached at the end of the report, Appendix A and B

2) In every test results, the margins against the limits are shown.
The margins are calculated as following;

$$MARGIN[dB] = 20 \log(R/L)$$

where, R : Corrected Results, [μV] or [$\mu V/m$],
L : Corresponding Limit, [μV] or [$\mu V/m$]

3) The tight limit is applied at the edge of two frequency band.
