COMMENTS: The Motorola designators are special code numbers for active devices used in Motorola radios. These devices are either identical or derived from the device family listed under Industry Equivalent, by the manufacturer or are proprietary to Motorola. Service people do not have

access to any cross-references or given any information on proprietary devices and are prevented from making unauthorized substitution.

LIST OF RECOMMENDED TEST EQUIPMENT FOR SERVICING

Instrument	Recommended Type	Application
RF Signal Generator *	HP 8656B or equivalent	Receiver Measurements
Modulation Analyzer *	HP 8901B or equivalent	Frequency and Deviation Measurements
Audio Analyzer *	HP 8903A or equivalent	Receiver Measurements
Power Meter *	HP 438A or equivalent	Transmitter Power Output
Power Sensor *	HP 8482A or equivalent	Transmitter Power Output
DC Power Supply	0-20 volts at 15 amps	
Attenuator Pad *	50 Ω , 75 Watts, 30 dB	Transmitter Measurements
DC Ammeter	30 mA to 20 A	Current Drain Measurements
Computer	IBM PC, PC/XT or PC/AT	Radio Alignment
Radio Interface Box (RIB)	RLN-4008	Computer to Radio Interface
Cable	30-80369B71 (25-pin) or 30-80369B72 (9-pin)	RIB to Computer
Cable	01-80300B10	RIB to Radio
Software	RVN-4150	Radio Alignment

* These items can be replaced by a Motorola 2000 Series Communications System Analyzer or equivalent piece of integrated communications test equipment.

TUNE-UP INFORMATION

This exhibit contains the tuning procedure in the same general format as will appear in the service manual.

All transmitter adjustments are performed by electronic means. The transmitter contains no electromechanical components for the purpose of transmitter tuning or adjustment.

The tuning elements that are used for transmitter adjustment are:

Location	Type of Element	Function
U101	Microcomputer	Monitors Output of Power Sampling and Current Limiting Circuits and Supplies data to Attenuators, Temperature Compensated Crystal Oscillator, and Digital to Analog Converter for Transmitter Modulation, Frequency and Power Adjustment
U105	EEPROM	Data Storage of all Tuning Parameters
U201	Programmable Attenuator	Deviation Adjustment
U5700	Temperature Compensated Crystal Oscillator	Transmitter Frequency Adjustment
U5702	Programmable Attenuator	VCO Modulation Sensitivity
U5702	Programmable Attenuator	Reference Modulation Sensitivity

The value of a particular tuning element is determined by data sent to that tuning element by microcomputer U101. This data is generated by the microcomputer based on tuning information that is stored in an Electrically Erasable Programmable Read Only Memory (EEPROM), U105.

Tuning information is stored in the EEPROM during factory adjustment or by qualified field service facilities, using the attached procedure and recommended test equipment.

TUNING PROCEDURE

The tuning procedure assumes that an integrated piece of test equipment is being used. This test equipment is usually referred to as a Communications Systems Analyzer (CSA) and combines the functions of many separate pieces of test equipment. The Radio Service Software (RSS) allows a Service Technician to electronically adjust or calibrate the radio without opening the radio housing to gain access to manual controls (potentiometers, variable capacitors, etc.).

Alignment versus Calibration

The term "Alignment" is defined as the ability, through the RSS, to adjust the maximum deviation, the frequency of the reference oscillator and the coarse output power of the transmitter. Alignment is performed at a single frequency that is normally at the center of the operating range.

The term "Calibration" is defined as the ability, through the RSS, to adjust the RF output power and the maximum system deviation of the transmitter on sixteen (16) frequency points that span the entire bandwidth of the radio.

When the radio is calibrated at the factory, it will perform within specification on any customer frequency within the frequency band. Therefore, any further adjustment or calibration should not be necessary in the field. The only exception is the alignment of the reference oscillator. Due to the aging characteristics of quartz crystals, the frequency of the oscillator may change over time. This requires that the frequency of the reference oscillator is periodically readjusted.

Periodic adjustment is not necessary for the output power and the maximum deviation of the transmitter. These operational characteristics of the transmitter do not change over time. It is not recommended to use the adjustment windows for output power and deviation unless absolutely necessary. If an output power adjustment greater than 10 percent is encountered, then the test equipment, cables and antenna loads should be verified as not being defective. If the maximum deviation adjustment is greater than 10 percent, the test equipment should be checked. If the radio is operating beyond these limits, it is recommended that the calibration be performed instead of alignment.

The procedures for Alignment and Calibration are explained in the next paragraphs.

Alignment

A. Test Setup and Initial Reading of Radio Data

1. Connect the radio to an IBM® PC or compatible computer using the Radio Interface Box (RIB) and the appropriate cables.
2. Connect the "RF In/Out" of the CSA to the antenna connector of the radio.
3. Connect the CSA "Mod Out" port to the audio input connector of the breakout box in the cable from the RIB to the radio
4. Turn on power to all equipment.
5. Start the Radio Service Software (RSS) for the radio.
6. From the "Main Menu", press F2, " SERVICE Alignment, Service Aids, Board Replacement". The "Alignment Menu" is shown in Figure 11.1.

Figure 11.1 – Alignment Menu

B. Transmitter Deviation Adjustment

The Transmit Deviation Adjustment allows adjustment of the maximum deviation. This adjustment affects all of the frequencies within the operating bandwidth of the radio.

1. Press F3, "DEVIATION Adjustment". The adjustments for the "Balance" and "Deviation" attenuators are shown in Figure 11.2.

Figure 11.2 – Transmit Deviation Adjustments

2. The "Balance" attenuator is adjusted first. Key the transmitter by pressing F6, "Toggle PTT".
3. Measure the deviation of the 60 Hz modulating tone of the transmitter with the CSA.
4. Press F4, "60/2.5 kHz", to change to the 2.5 kHz modulating tone.
5. Measure the deviation of the 2.5 kHz modulating tone of the transmitter with the CSA.
6. Use the Up/Down arrow keys to equalize the deviation for the 60 Hz and 2.5 kHz tones.
7. Press F3, "Toggle Line" to select the "Deviation Attenuator Adjustment".
8. Adjust the output level of the "Mod Out" of the 1 kHz tone output of the CSA to 800-mV rms.
9. Measure the deviation of the 1 kHz modulating tone of the transmitter with the CSA.
10. Use the Up/Down arrow keys to adjust the deviation of the 1 kHz tone until the correct deviation is obtained. If the radio cannot be adjusted for rated deviation and the Relative Value is at a maximum or a minimum value, refer to the service manual for the radio for repair procedures.
11. Press F6, "Toggle PTT", to unkey the transmitter.
12. Press F8, "Program Value", to store the new data in the codeplug of the radio.

C. Transmit Frequency Adjustment (Warp)

The Transmit Frequency Warp window allows adjustment of the frequency of the 16.8 MHz reference oscillator (TXCO). The screen displays a relative scale of the alignment range available and the current position of the alignment inside that range.

1. Select "REFERENCE OSCILLATOR WARP" from the alignment menu. The reference oscillator warp screen is shown in Figure 11.3.

Figure 11.3 – Reference Oscillator Warp

2. Press F6, "Toggle PTT", to key the transmitter.
3. Measure the frequency of the transmitter with the CSA.
4. Use the Up/Down arrow keys to adjust the frequency of the transmitter. If the radio cannot be adjusted for the correct test frequency and the Relative Value is at a maximum or a minimum value, refer to the service manual for the radio for repair procedures.
5. Press F6, "Toggle PTT", to unkey the transmitter.
6. Press F8, "Program Value", to store the new data in the codeplug of the radio.

D. Transmit Power Adjustment

The Transmitter Power Adjustment screen allows electronic adjustment of the RF output power of the transmitter. The screen displays a relative scale of the range available and the current position of the alignment within that range.

1. Press F7, "TRANSMITTER POWER Adjustment" from the alignment menu. The transmitter power adjustment screen is shown in Figure 11.4.

Figure 11.4 –Transmit Power Adjustment

2. Press F6, "Toggle PTT", to key the transmitter.
3. Measure the RF output power of the transmitter with the CSA.

4. Use the Up/Down arrow keys to adjust the output power of the transmitter. If the radio cannot be adjusted for the correct output power and the Relative Value is at a maximum or a minimum value, refer to the service manual for the radio for repair procedures.
5. Press F6, "Toggle PTT", to unkey the transmitter.
6. Press F8, "Program Value", to store the new data in the codeplug of the radio.

Calibration

A. Test Setup and Initial Reading of Radio Data

1. Connect the radio to an IBM® PC or compatible computer using the Radio Interface Box (RIB) and the appropriate cables.
2. Connect the "RF In/Out" of the CSA to the antenna connector of the radio.
3. Connect the CSA "Mod Out" port to the audio input connector of the breakout box in the cable from the RIB to the radio
4. Turn on power to all equipment.
5. Start the Radio Service Software (RSS) for the radio.
6. From the "Main Menu", press F6, " BOARD REPLACEMENT Procedures".
7. Press F2, "LOGIC OR RF BOARD", from the Board Replacement Menu. The "Logic or RF Board Replacement Procedure" screen is shown in Figure 11.6.

Figure 11.6 – Logic or RF Board Replacement Procedure

8. Press F2, "Enter Alignment Default data" from the board replacement menu.
9. Press F8, "Program Value", if the default tuning data is required or, press F10, "Exit", if the present values are sufficient.

B. Set Transmit Power

The Transmitter Power Adjustment screen allows electronic adjustment of the RF output power of the transmitter. The screen displays a relative scale of the range available and the current position of the alignment within that range.

1. Press F3, "Set TX POWER" from the board replacement menu. The transmitter power adjustment screen is shown in Figure 11.7.

Figure 11.7 – Transmit Power Adjustment

2. Press F6, "Toggle PTT", to key the transmitter.
3. Measure the RF output power of the transmitter with the CSA.
4. Use the Up/Down arrow keys to adjust the output power of the transmitter. If the radio cannot be adjusted for the correct output power and the Relative Value is at a maximum or a minimum value, refer to the service manual for the radio for repair procedures.
5. Press F6, "Toggle PTT", to unkey the transmitter.
6. Press F8, "Program Value", to store the new data in the codeplug of the radio.

C. Warp Transmit Frequency

The Warp Reference Oscillator screen allows adjustment of the frequency of the 16.8 MHz reference oscillator (TXCO). The screen displays a relative scale of the alignment range available and the current position of the alignment inside that range.

1. Press F4, "WARP REFERENCE OSCILLATOR" from the replacement menu. The reference oscillator warp screen is shown in Figure 11.8.

Figure 11.8 – Reference Oscillator Warp

2. Press F6, "Toggle PTT", to key the transmitter.
3. Measure the frequency of the transmitter with the CSA.

4. Use the Up/Down arrow keys to adjust the frequency of the transmitter. If the radio cannot be adjusted for the correct test frequency and the Relative Value is at a maximum or a minimum value, refer to the service manual for the radio for repair procedures.
5. Press F6, "Toggle PTT", to unkey the transmitter.
6. Press F8, "Program Value", to store the new data in the codeplug of the radio.

D. Transmit Power Calibration

The Transmitter Power Calibration window allows adjusting the RF output power of the transmitter across the operating bandwidth of the radio. The screen displays the relative value within the allowable range for each of sixteen (16) tuning points. Use the following procedure to calibrate the output power settings.

1. Press F5, "Set TX POWER CALIBRATION" from the board replacement menu. The transmitter power calibration procedure is shown in Figure 11.9.

Figure 11.9 –Transmitter Power Calibration

2. Press F6, "Toggle PTT", to key the transmitter.
3. Measure the RF output power of the transmitter with the CSA.
4. Use the Up/Down arrow keys to adjust the output power of the transmitter. If the radio cannot be adjusted for the correct output power and the Relative Value is at a maximum or a minimum value, refer to the service manual for the radio for repair procedures.
5. Record the current drain of the radio for the proper output power level.
6. Press F6, "Toggle PTT", to unkey the transmitter.
7. Press "Tab" to advance to the next tuning point.
8. Repeat steps 2 to 6 to adjust the output power and record the current drain for all sixteen (16) tuning points.
9. Press F8, "Program Value", to store the new data in the codeplug of the radio.

E. Transmit Current Limit Adjustment

The Transmitter Current Limit Adjust window allows adjusting the maximum current drain of the transmitter of the radio. The screen displays the relative value within the allowable range. Use the following procedure to calibrate the current limit.

1. Press F10, "Exit". The transmitter current limit adjust screen is shown in Figure 11.10.

Figure 11.10 –Transmit Current Limit Adjust

2. Press "Tab" to advance to the "TX Frequency" highlight.
3. Use the Up/Down arrow keys to select the test frequency corresponding to the highest current drain recorded during the setting of the output power.
4. Press F6, "Toggle PTT", to key the transmitter.
5. Measure the current of the transmitter.
6. Press F6, "Toggle PTT", to unkey the transmitter.
7. Press "Tab" to return to "Relative Value" highlight.
8. Press F6, "Toggle PTT", to key the transmitter.
9. Use the Up/Down arrow keys to adjust the current limit point between the limits as specified in the service manual (section entitled "Transmit Current Limit").
10. Press F6, "Toggle PTT", to unkey the transmitter.
11. Press F8, "Program Value", to store the new data in the codeplug of the radio.

F. Transmit Deviation Calibration

The Transmit Deviation Calibration screens allow adjustment of the modulation balance and the maximum deviation at sixteen (16) frequency points across the operating bandwidth of the radio. The screens display the frequency to which the transmitter has been programmed by the RSS and a relative scale for the value of the balance and the maximum deviation at each frequency.

Modulation Balance

1. Press F6, "Set TX DEVIATION CALIBRATION", from the board replacement menu. The balance calibration screen is shown in Figure 11.11.

Figure 11.11 – Transmit Deviation Calibration

2. Key the transmitter by pressing F6, "Toggle PTT".
3. Measure the deviation of the 60 Hz modulating tone of the transmitter with the CSA.
4. Press F4, "60/2.5 kHz", to change to the 2.5 kHz modulating tone.
5. Measure the deviation of the 2.5 kHz modulating tone of the transmitter with the CSA.
6. Use the Up/Down arrow keys to equalize the deviation for the 60 Hz and 2.5 kHz tones. The ratio of the deviations should be within 0.5-dB.
7. Press F6, "Toggle PTT", to unkey the transmitter.
8. Press "Tab" to advance to the next tuning point.
- 9) Repeat steps 2 to 8 to adjust the modulation balance at each of the sixteen (16) tuning points.
- 10) Press F8, "Program Value", to store the new data in the codeplug of the radio.

Deviation Calibration

1. Adjust the output level of the 1 kHz tone from the "Mod Out" of the CSA to 800-mV rms.
2. Press F10, "Exit", to terminate the balancing adjustments and enter the deviation calibration procedure. The deviation calibration screen is shown in Figure 11.12.

Figure 11.12 – Transmit Deviation Calibration

3. Press F6, "Toggle PTT", to key the transmitter.

4. Measure the deviation of the 1 kHz modulating tone of the transmitter with the CSA.
5. Use the Up/Down arrow keys to adjust the deviation of the 1 kHz tone until the correct deviation is obtained. If the radio cannot be adjusted for rated deviation and the Relative Value is at a maximum or a minimum value, refer to the service manual for the radio for repair procedures.
6. Press F6, "Toggle PTT", to unkey the transmitter.
7. Press "Tab" to advance to the next tuning point.
8. Repeat steps 3 to 7 to adjust the transmitter deviation at each of the sixteen (16) tuning points.
9. Press F8, "Program Value", to store the new data in the codeplug of the radio.
