ANNOUNCEMENT

- This test report shall not be reproduced in full or partial, without the written approval of UL Japan, Inc.
- The results in this report apply only to the sample tested. (Laboratory was not involved in sampling.)
- This sample tested is in compliance with the limits of the above regulation.
- The test results in this test report are traceable to the national or international standards.
- This test report must not be used by the customer to claim product certification, approval, or endorsement by the A2LA accreditation body.
- This test report covers Radio technical requirements.
It does not cover administrative issues such as Manual or non-Radio test related Requirements. (if applicable)
- The all test items in this test report are conducted by UL Japan, Inc. Ise EMC Lab.
- The opinions and the interpretations to the result of the description in this report are outside scopes where UL Japan, Inc. has been accredited.
- The information provided by the customer for this report is identified in SECTION 1.
- The laboratory is not responsible for information provided by the customer which can impact the validity of the results.
- For test report(s) referred in this report, the latest version (including any revisions) is always referred.

SECTION 2: Equipment Under Test (EUT)

2.1. Identification of EUT

Description	Wireless Charger
Model Number	AH2302
Serial Number	Refer to SECTION 4.2
Condition	Engineering prototype (Not for Sale: This sample is equivalent to mass-produced items.)
Modification	No Modification by the test lab
Receipt Date	November 25, 2024
Test Date	December 2 to 19, 2024

2.2. Product Description

General Specification

Rating	DC +9 V to +16 V (Typ: +13.2 V)
Feature of EUT	Use the ACC KEY of the car to turn the Wireless charger power ON/OFF. Charging will begin when you place the portable device (etc. mobile phone) with the charging side facing down. If charging is not occurring, try placing the portable device as close to the center of the charging area as possible.

Radio Specification

Frequency Band	124.6 kHz / 127.8 kHz / 129.5 kHz / 120.4 kHz to 134.3 kHz
Rated Output Power	5 W / 15 W
Coil system	Single Coil
Charging distance	Contact

SECTION 3: Test Specification, Procedures & Results

3.1 Test specification

Test Specification	FCC Part 18 The latest version on the first day of the testing period
Title	FCC 47CFR Part18 Industrial, scientific, and medical equipment

3.2 Procedures and results

Item	Test Procedure & Limits	Worst margin	Result	Remarks

Conducted Emission	Section 18.307 FCC/OET MP-5	-	N/A	*1)
* Note: UL Japan, Inc.'s EMI Work Procedure: Work Instructions-ULID-003591.				
*1) The test is not applicable since the EUT is not the device that is designed to be connected to the public utility (AC) power line.				

3.3 Addition to standard

No addition, exclusion nor deviation has been made from the standard.

3.4 Uncertainty

EMI

Measurement uncertainty is not taken into account when stating conformity with a specified requirement.
Note: When margins obtained from test results are less than the measurement uncertainty, the test results may exceed the limit.

The following uncertainties have been calculated to provide a confidence level of 95 % using a coverage factor $k = 2$.

Radiated emission

Measurement distance	Frequency range		Unit	Calculated Uncertainty (+/-)
3 m	9 kHz to 30 MHz		dB	3.3
10 m			dB	3.1
3 m	30 MHz to 200 MHz	Horizontal	dB	5.0

SECTION 4: Operation of EUT during testing

4.1. Operating mode(s)

Test mode	Remarks
1) Normal Charging mode (CW+FSK, 124.6 kHz / EPP 15 W) *3)	Used for Receiver JIG *1)
2) Normal Charging mode (CW+FSK, 127.8 kHz / EPP 15 W) *3)	Used for Receiver JIG *1)
3) Normal Charging mode (CW+FSK, 129.5 kHz / EPP 15 W) *3)	Used for Receiver JIG *1)
4) Normal Charging mode (FSK, 120.4 kHz Neg 3 / EPP 15 W)	Used for Receiver *2)
5) Normal Charging mode (FSK, 128.6 kHz Pos 0 / EPP 15 W)	Used for Receiver *2)
6) Normal Charging mode (FSK, 134.3 kHz Pos 3 / EPP 15 W)	Used for Receiver *2)

Justification: The system was configured in typical fashion (as a user would normally use it) for testing.

*1) For Mode 1 to 3, after the output level between 5 W and 15 W were compared at pre-check, the test was performed only with 15 W as representative, which had the worst result.

*2) For Mode 4 to 6, after the output level of 8 types of modulation (Neg 0 to 3, Pos 0 to 3) was compared at pre-check, the test was performed with worst case.

*3) The 15 W transmission also outputs CW and FSK transmissions. The frequency listed for the mode is the CW transmission frequency.

4.2. Configuration and peripherals

Mode 1 to 3

*A and B communicate and charge via air interface.

Mode 4 to 6

*A and C communicate and charge via air interface.

*Cabling and setup were taken into consideration and test data was taken under worse case conditions.

5.2 Test configuration

EUT was placed on a urethane platform of nominal size, 1.0 m by 1.5 m, raised 1.0 m above the conducting ground plane.

The EUT was set on the edge of the tabletop.

Test was made with the antenna positioned in 0 deg., 45 deg., 90 deg., 135 deg., 180 deg., and Horizontal. The measurement antenna was varied in height above the conducting ground plane to obtain the maximum signal strength.

Photographs of the set up are shown in Appendix 3.

*Refer to Figure 1 about Direction of the Loop Antenna.

5.3 Test conditions

Frequency range	9 kHz to 30 MHz (Loop antenna)
	30 MHz to 200 MHz (Biconical antenna)
	200 MHz to 400 MHz (Logperiodic antenna)
Test distance	3 m / 10 m
EUT position	Table top
EUT operation mode	See Clause 4.1

5.4 Test procedure

[Below 30 MHz]

The height of antenna was fixed in 2 m.

EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity.

The measurements were performed in 0 deg., 45 deg., 90 deg., 135deg., 180 deg., and Horizontal with the Test Receiver.

0 deg. of antenna position was made as the representative position for the tests since noise level was equivalent in all three positions.

The electric field intensity at a distance of 300 m was calculated from the measurement results at distances of 3 m and 10 m.

[Above 30 MHz]

Maximum electric field intensity was confirmed with the measurements at distances of 3 m and 10 m. The electric field intensity at a distance of 300 m was calculated from the measurement results at distances of 3 m and 10 m.

The radiated emission measurements were made with the following detector function of the test receiver.

The test was made with the detector (RBW) in the following table.

Frequency	9 kHz to 150 kHz	150 kHz to 30 MHz	30 MHz to 400 MHz
Instrument used	Test Receiver		
IF Bandwidth	AV: 200 Hz	AV: 9 kHz	AV: 120 kHz

The measurement result was calculated by the following formula:

[Frequency at which the signal was confirmed at both 10 m and 3 m]

Result = Reading + ANT Factor + Cable loss + Atten loss + Extrapolation Factor - AMP gain

Extrapolation Factor = decade * Log (Test distance (3 m) / Separate distance (300 m))

decade = (10 m reading - 3 m reading) / (log 3 m - log 10 m)

*Refer to Part 18 Section 305 Notes 2 and KDB 629601.

[Other Frequency]

Result = Reading + ANT Factor + Cable loss + Atten loss + Extrapolation Factor - AMP gain

Extrapolation Factor = 20 * Log (Test distance (3 m) / Separate distance (300 m))

<Test Setup>

Below 1 GHz

Test Distance: 3 m / 10 m

The test results and limit are rounded off to one decimal place, so some differences might be observed.

5.5 Test result

Summary of the test results: Pass

decade = (10 m reading - 3 m reading) / (log 3 m - log 10 m)

*1) Used for the square of an inverse linear distance extrapolation factor (20 dB/decade)
Except for the above table : adequate margin data below the limits.

10 m Reading of Extrapolation Factor is used the value of 0 deg.
Worst direction of EUT was decided by test result performed on test distance at 3 m, and test distance at 10 m was performed worst direction.

CALCULATION(Result) : Reading + ANT Factor + Cable loss + Atten loss + Extrapolation Factor - AMP gain
Extrapolation Factor = decade * Log (Test distance(3 m) / Separate distance(300 m))
decade = (10 m reading - 3 m reading) / (log 3 m - log 10 m)

*1) Used for the square of an inverse linear distance extrapolation factor (20 dB/decade)
Except for the above table : adequate margin data below the limits.

10 m Reading of Extrapolation Factor is used the value of 0 deg.
Worst direction of EUT was decided by test result performed on test distance at 3 m, and test distance at 10 m was performed worst direction.

CALCULATION(Results): $\text{Flow}(\text{in}) = \text{ANT} \cdot \text{Flow}(\text{in}) + \text{C} \cdot \text{Flow}(\text{in}) + \text{Att}(\text{in}) + \text{Ext}(\text{in}) - \text{Flow}(\text{out}) - \text{AMP}(\text{in})$

*1) Used for the square of an inverse linear distance extrapolation factor (20 dB/decade)
Except for the above table : adequate margin data below the limits.

CALCULATION(Result) : Reading + ANT Factor + Cable loss + Atten loss + Extrapolation Factor - AMP gain
 Extrapolation Factor = decade * Log (Test distance(3m) / Separate distance(300m))
 decade = (10m reading - 3m reading) / (log 3m - log 10m)

*1) Used for the square of an inverse linear distance extrapolation factor (20 dB/decade)
Except for the above table : adequate margin data below the limits.

Worst direction of EUT was decided by test result performed on test distance at 3 m, and test distance at 10 m was performed worst direction.

*Hyphens for Last Calibration Date and Cal Int (month) are instruments that Calibration is not required (e.g. software), or instruments checked in advance before use.

The expiration date of the calibration is the end of the expired month.

As for some calibrations performed after the tested dates, those test equipment have been controlled by means of an unbroken chains of calibrations.

All equipment is calibrated with valid calibrations. Each measurement data is traceable to the national or international standards.
