Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure.

Note 2 to Table 1: General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or can not exercise control over their exposure.

Test limit was applied to the test limit of 100 kHz - 300 kHz based on FCC rule Section 1.1310, according to KDB 680106 D01 RF Exposure Wireless Charging Apps Section 3 c).

- a). Power transfer frequency is less than 1 MHz.
- b). Output power from each primary coil is less than or equal to 15 watts.
- c). The transfer system includes only single primary and secondary coils. This includes charging systems that may have multiple primary coils and clients that are able to detect and allow coupling only between individual pairs of coils.
- d). Client device is placed directly in contact with the transmitter.
- e). Mobile exposure conditions only (portable exposure conditions are not covered by this exclusion).
- f). The aggregate H-field strengths at 15 cm surrounding the device and 20 cm above the top surface from all simultaneous transmitting coils are demonstrated to be less than 50% of the MPE limit.

All requests were complied.

Also, Test data used Exposure Level Tester is complied KDB 680106 D01 RF Exposure Wireless Charging Apps Section 3 c).

*1): For this limit value, "General Population / Uncontrolled Exposure" of FCC § 1.1310 (e) (B) was used.

*2): This is the distance between the center of the probe and the edges of the EUT.

*3): This value was calculated by following formula.

Reading is from measurement tool ELT-400.

Reading(%) = (Actual magnetic density*100) / 6.25

(*Where the value 6.25 is decided IEC 62233:2005 Annex B Table B.2)

*Magnetic field strength [A/m]= Magnetic density / $4\pi \times 10^{-7}$

*Test result is less than 50 % of the MPE limit.

*1): For this limit value, "General Population / Uncontrolled Exposure" of FCC § 1.1310 (e) (B) was used.

*2): This is the distance between the center of the probe and the edges of the EUT.

*3): This value was calculated by following formula.

Reading is from measurement tool ELT-400.

Reading(%) = (Actual magnetic density*100) / 6.25

(*Where the value 6.25 is decided IEC 62233:2005 Annex B Table B.2)

*Magnetic field strength [A/m] = Magnetic density / $4\pi \times 10^{-7}$

*Test result is less than 50 % of the MPE limit.

*Hyphens for Last Calibration Date and Cal Int (month) are instruments that Calibration is not required (e.g. software), or instruments checked in advance before use.

The expiration date of the calibration is the end of the expired month.

As for some calibrations performed after the tested dates, those test equipment have been controlled by means of an unbroken chains of calibrations.

All equipment is calibrated with valid calibrations. Each measurement data is traceable to the national or international standards.
