EUT Description

The EUT is a UHD 4kp60 Cable Television Set-top box with an embedded multi-channel full-band capture QAM front-end receiver and video back-end processor supporting video presentation and transcoding as well as other embedded functions. It is capable of presenting encrypted SD and HD video content through HDMI™ 2.0 and Analog Composite (SD content only). Digital audio is presented through HDMI™ and Optical SPDIF, and analog audio is presented through baseband 3.5mm connector. It has a removable hard drive for DVR capability and dual USB3.0 ports for external peripherals. Wireless interfaces include Bluetooth 4.1+ HS-compliant 2.4 GHz transceiver with embedded antenna (NO 6LoWPAN functionality) and RF4CE with embedded antennas. It has front panel buttons and 38 kHz IR receiver for user interface. System memory consists of DDR4, eMMC and SPI Flash. The DCX900 is home networking capable through MoCA® and Gigabit Ethernet. This model has removable Cablecard for content security.

EUT Operation:

During Occupied Bandwidth, Peak Power Output, Antenna Terminal Out of Band/Band Edge Conducted Emissions, Spurious Radiated and Power Spectral Density, the EUT was continuously transmitting a modulated signal.

During Conducted Emissions, the EUT was continuously transmitting a modulated signal and video playback.

During Receiver Spurious, the EUT was continuously in video playback, not transmitting.

Retlif Testing Laboratories

Report No. R-2601P-1, Rev. D

Requirements and Test Results

Requirement:

Power Output

For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400-2483.5 MHz band: 0.125 watts.

- **Results:** The maximum measured peak conducted output power was 5.012 mW. The maximum antenna gain of the antenna is 2.0 dBi. The device was found to meet the power output requirements of 15.247 (b)(3) including de facto EIRP.

Requirement:

Antenna Terminal Out of Band/Band Edge Conducted Emissions

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under Paragraph (b)(3) of Section 15.247, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in Section 15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in Section 15.205(a) must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).

- **Results:** All measured out of band/band edge conducted emissions were below the specified limits and the device was found to meet the requirements of 15.247 (d).

Retlif Testing Laboratories

Report No. R-2601P-1, Rev. D

Requirements and Test Results (con't)

Requirement:

Radiated Spurious Emissions/Restricted Bands/Band Edge

Emissions which fall into restricted bands, as defined in 15.205(a) must comply with the radiated emissions limits specified in 15.209(a) and shown below in Table 3. Emissions emanating from the EUT cabinet and cables must also comply with the radiated emissions limits. Radiated emissions measurements were also performed at the band edges to ensure band edge compliance.

Table 3 - Radiated Emission Limits

Frequency of Emission (MHz)	Field Strength (microvolts/meter)	Measurement Distance (meters)
30 to 88	100	3
88 to 216	150	3
216 to 960	200	3
Above 960	500	3

- **Results:**

All spurious emissions were measured and found to be in compliance with the limits specified in 15.209(a). Band edge emissions were also found to be in compliance with the limits specified in 15.209(a).

Requirement:

Receiver Radiated Spurious Emissions

Spurious emissions from receivers must comply with the radiated emissions limits specified in RSS-Gen, Para. 7.1 and as shown above in Table 3.

- **Results:** No EUT receiver spurious emissions were observed within 10dB of the specified limit.

Retlif Testing Laboratories

Report No. R-2601P-1, Rev. D

Requirements and Test Results (con't)

Requirement:

Channel Separation and 20 dB Bandwidth

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

- **Results:**

The maximum 20 dB bandwidth of the hopping channel was 1.1823 MHz. The carrier frequencies were separated by 1.0257 MHz which exceeds 25 kHz or two-thirds (2/3) the 20 dB bandwidth and complies with the requirements specified above.

Requirement:

Number of Channels and Occupancy Time

Frequency hopping systems in the 2400-2483.5 MHz band shall use at least 15 channels. The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

- **Results:**

The frequency hopping system uses 79 Channels. The average time of occupancy did not exceed 0.4 seconds in a 31.6 second period which meets the above requirements.

Requirements and Test Results (con't)

RF Exposure

Spread Spectrum Transmitters operating under 15.247 must be operated in a manner that ensures the public is not exposed to RF energy levels in excess of the commission's guidelines. Based on the transmitter power and maximum antenna gain (see calculation below) the minimum separation distance was calculated to determine the distance for acceptable MPE power density levels to meet both the Occupational/Controlled Exposure and the General Population/Uncontrolled Exposure requirements of FCC Part 1.1310. The calculation below uses the more stringent General Population MPE Limits.

$$S = \frac{PG}{4\pi D^2}$$

D = Minimum Separation Distance in cm

S = Max allowed Power Density in mW/cm²

Per 1.1310 For the Frequency of 2400 MHz S = 1 mW/cm²

FHSS Transmission Mode:

Power = Max Power Input to Antenna = 5.012 mW

Gain = Max Power Gain of Antenna = 2.0 dBi = 1.6 numeric

$$0.6 \text{ mW/cm}^2 = \frac{5.012 \times 1.6}{4 (3.14) \times D^2} = \frac{8.0192}{12.56 \times D^2}$$

$$D^2 = \frac{8.0192}{12.56 \times 1.0}$$

$$D = \sqrt{0.6384} = 0.799 \text{ cm}$$

The calculation above uses the highest power level for the device in this band.

Retlif Testing Laboratories

Report No. R-2601P-1, Rev. D

Requirement:**Conducted Limits**

For an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits shown in Table 4, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of the paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Table 4 - Conducted Emission Limits

Frequency of Emission (MHz)	Conducted Limit (dB μ V)	
	Quasi-Peak	Average
0.15 to 0.5	66 to 56*	56 to 46*
0.5 to 5	56	46
5 to 30	60	50
*Decreases due to logarithm of the frequency		

- **Results:**

The conducted emissions observed did not exceed the limits specified in Table 4.
