5 OCCUPIED BANDWIDTH (FCC Rule § 2.989)

5.1 Measuring Method

FCC rule 47 CFR 2.989 requires measurements of the occupied bandwidth which is defined in the same section as "the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission."

To obtain the occupied bandwidth of the radar transmitter, a special program (program list shown below) was loaded to the Hewlett-Packard spectrum analyzer and run by entering the HP-provided POWER BANDWIDTH calculation command [PWRBW].

The result was automatically displayed on the screen on the spectrum analyzer as:

POWER_BW=----- MHz

ANTENNA UNIT

TRANSCEIVER MODULE (RTR-065)

Modulator PCB 03P9235

The primary function of the modulator is to produce narrow high tension pulses to drive the magnetron. To produce such pulses, the modulator board incorporates a modulator trigger circuit, a modulating pulse generator and a booster pulse transformer.

The modulator trigger circuit is composed of U805 and associated components. It generates pulses that fire modulator FET Q805, Q806. Normally, the circuit is stable with U805 off. The pulse to fire the modulator FET is produced when U805 turns on upon receiving the TX trigger pulse from the display unit. When U805 turns on at the positive-going edge of the TX trigger pulse, it produces a narrow pulse. This narrow pulse is boosted by pulse transformer T802 by the ratio 1:21. The resultant pulse, its level being 4.5 kV, is provided to limit the magnetron current.

C820 decouples the pulse energy that is liable to occur across the magnetron heater when T802's secondary windings are unbalanced or the load is asymmetric.

Also incorporated in the modulator board are the TX HV circuit and magnetron heater power supply circuit. The TX HV circuit provides a high tension of about 330 V to the pulse forming network through CR802, CR805. A DC voltage of 7.6 V is supplied to the magnetron heater through CR801.

Duplexer and Frequency Converter

The microwave energy produced by the magnetron enters the circulator from port 2. It is fed to port 3 with a negligible loss of energy; port 1 at this time is isolated. In the same manner, the received signal entering into port 3 is transferred to port 1, isolating port 2. This operation of the circulator protects the receiver during transmission and minimizes the loss of the received signal. Thus, the circulator allows a single antenna radiator to be

used for transmission and reception of radar signals.

A diode limiter, made up of a pair of PIN diodes, is incorporated in the first stage of the MIC (microwave IC, U801). It is a passive switching device which allows the low-level RF signal to pass through and prohibits relatively strong microwave energy, such as the leak from the magnetron. It also protects the sensitive amplifier from pulses received direct from other radars operating in the proximity.

When a low-level signal is received, the PIN diodes remain in the cutoff state, and the limiter's input impedance matches the characteristic impedance of the receiver allowing the signal to be delivered to the frequency converter of U801. When strong microwave energy is received, the PIN diodes are put in the conductive state (or short-circuited) causing the input energy to be attenuated. The strong input is further reduced to about 150 mW by the varacter diode.

The MIC converts 9 GHz RF signal into an intermediate frequency of 60 MHz. It is achieved by mixing the received signal with the local oscillator signal in the frequency converter of the MIC. The built-in local oscillator oscillates at a frequency 60 MHz higher than the magnetron frequency of 9410 MHz.

IF Amplifier IF9215

The received 60 MHz IF signal is amplified by the IF amplifier, the output of which is delivered to the Digital Signal Processor of the Display Unit. The 60 MHz IF signal from the MIC is fed to the IF amplifier U1.

The output of U1 is conductively coupled to the second-stage IF amplifier U2.

GAIN/STC signals are applied respectively to U1's pin 5 and U2's pin 14 via the STC circuit. The output of U2 is then coupled to video amplifier Q1. The video signal is taken from the emitter of Q2/Q3 through C25, and sent to the display via the video cable.

The IF amplifier PCB also incorporates an STC circuit. The STC circuit made up of Q10, Q11 changes the gain of the IF amplifier in the function of time so that the gain is minimum at the time of transmission and increases gradually to maximum gain with time (range).

The amount of current flowing into Q 11 is determined by the time constant of the parallel-series capacitor/resistor network consisting of C50 to C52, R67 to R69. It gradually decreases as the capacitors are discharged. The rate of discharge is inversely proportional to "t", the elapsed time after transmission. The current flowing into Q 11 is also controlled by the base potential in addition to the time constant of the capacitor/resistor network.

The time-varying waveform produced at capacitor/resistor network is restored via CR18 by the STC control potentiometer (located in the display) and applied to U1's pin 5 and U2's pin14.

8.4 Frequency Tolerance Limits:

"The frequency at which maximum emission occurs must be within the authorized bandwidth and must not be closer than $1.5/T$ MHz to the upper and lower limits of the authorized band width, where "T" is the pulse duration in microseconds. " (FCC Rule § 80.209)

1) Center frequency (f_0): 9410 MHz

2) Authorized bandwidth ($f(\text{AUBW})$): 100 MHz

"Upper limit frequency of the authorized band", $f(\text{UAUBW}) = f_0 + f(\text{AUBW})/2 = 9460$ Mhz

"Lower limit frequency of the authorized band", $f(\text{LAUBW}) = f_0 - f(\text{AUBW})/2 = 9360$ Mhz

3) Assignable frequency bandwidth : 200 MHz (between 9300 MHz and 9500 MHz)
(FCC Rule § 80.375 (d)-(1))

"Upper limit frequency of the assignable band", $f(\text{UASB}) = 9500$ MHz

"Lower limit frequency of the assignable band", $f(\text{LASB}) = 9300$ MHz

4) Guard Band ($f(1.5/T)$) :

Pulse Type	Short	Middle	Long
Range Scale (nm)	0.25	2	48
Pulselength (μ sec)	0.08	0.30	0.80
Guard Band $f(1.5/T)$ (MHz)	18.75	5.00	1.88

8.5 Test Results:

Shown on Fig. 8.2.

(1) "Upper Tolerance Frequency measured (at -20°C)", $f(\text{U}) = 9425.5$ MHz

(2) "Lower Tolerance Frequency measured (at $+50^\circ\text{C}$)", $f(\text{L}) = 9402.0$ MHz

(3)-(a)

$f(\text{U}) + \text{max. } f(1.5/T) = 9444.25 \text{ MHz} < f(\text{UAUBW}) = 9460 \text{ MHz} < f(\text{UASB}) = 9500 \text{ MHz}$

(b)

$f(\text{L}) - \text{max. } f(1.5/T) = 9383.25 \text{ MHz} > f(\text{LAUBW}) = 9360 \text{ MHz} > f(\text{LASB}) = 9300 \text{ MHz}$

So, both are found within the specified limits.

8 FREQUENCY STABILITY (FCC Rule § 2.995)

8.1 Setup for Measurement

Fig. 8.1

8.2 Test Conditions:

- 1) Radar Range settings : 0.25 nm (Short)/2 nm (Middle)/48 nm (Long)
- 2) Ambient Temperature settings: - 20 to + 50 °C (10 °C step)
- 3) Power Supply Voltage settings: 85 /15 % of nominal voltage (20.4 to 27.5 VDC)

8.3 Measuring Equipment List:
