4 OCCUPIED BANDWIDTH (FCC ,2.989)

4.1 Measuring Method

FCC rule 47 CFR ,2.989 requires measurements of the occupied bandwidth which is defined in the same section as "the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission."

To obtain the occupied bandwidth of the radar transmitter, a special program (program list shown below) was loaded to the Hewlett-Packard spectrum analyzer HP 71210C and run by entering the HP-provided POWER BANDWIDTH calculation command [PWRBW]. The result was automatically displayed on the screen on the spectrum analyzer as:

POWER_BW=----- MHz

11 SUPPRESSION OF INTERFERENCE ABOARD SHIP (FCC §80.217)

11.1 Measuring Antenna Characteristics at Representative Frequencies

Whip antennas are used to determine the level of interference caused by the radar to shipboard receivers. These antennas have the following characteristics (refer to impedance charts attached):

Length	Tested Frequency	Impedance	θ	R	C or L
6m	500.5 kHz	1 k Ω	-90°	0 Ω	80 pF
6m	1.992 MHz	1.25 k Ω	-86°	87.2 Ω	64 pF
6m	10.00204 MHz	158 Ω		109 Ω	140 pF
4m	27.5 MHz	95 Ω		83.5 Ω	128 pF
5/8 λ	150 MHz	116.5 Ω		105.5 Ω	52.5 nH
1/4 λ	450 MHz	70.5 Ω		34.5 Ω	5.68 pF
