1.0 General Description

1.1 Product Description

The Equipment under Test (EUT) is VHF/UHF Programmable AM/FM-Digital Trunking Handheld Scanning Receiver PRO-96 CAT. NO. 20-526.

Please refer to the attached specifications sheets in Appendix A for more details.

A pre-production version of the sample was received on May 18, 2003 in good condition. As declared by the Applicant, it is identical to production units.

1.2 Related Submittal(s) Grants

This is a single Application for Certification of a scanning receiver.

1.3 Test Methodology

Both AC mains line-conducted (if applicable) and radiated emission measurements were performed according to the procedures in ANSI C63.4 (1992). All radiated measurements were performed in a semi-anechoic chamber. Radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the **“Data Section”** of this Application.

1.4 Test Facility

The test site and conducted measurement facility used to collect the radiated data is Site 1 (10-m semi-anechoic chamber). This test facility and site measurement data have been fully placed on file with the FCC and A2LA accredited.

2.0 System Test Configuration

FCC ID: ADV2000526

2.1 Justification

The tests were performed according to the test procedure as outlined in CFR47 Part 15.31 and in ANSI C63.4.

For emission testing, the equipment under test (EUT) was configured for testing in a typical fashion (as a customer would normally use it). During testing, all cables were manipulated to produce worst-case emissions.

For the measurements, the EUT is placed on top of a non-conductive table. If the EUT attaches to peripherals, they are connected and operational (as typical as possible).

For radiated emission measurements, the signal is maximized through rotation and placement in the three orthogonal axes. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters. Radiated emissions are taken at three meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. All readings are extrapolated back to the equivalent three-meter reading using inverse scaling with distance if measured at a closer distance.

2.2 EUT Exercising Software

The unit was setup to receive continuously to simplify the measurement methodology. Care was taken to ensure proper power supply voltages during testing.

2.3 Mode of Operation

The EUT was tested in two modes and the worst-case emission was recorded:

Test Mode 1: The EUT was set to constantly receive at a particular frequency (1 near the top, 1 near the middle, and 1 near the bottom of each band).

Test Mode 2: The EUT was set to constantly scan and receive a particular band.

GRE, Model No: 20-526

FCC ID: ADV2000526

Date of Test: May 19, 2003

2.4 Support Equipment List and Description

None. The EUT was tested as a stand-alone device.

2.5 Equipment Setup Block Diagram

2.6 Equipment Modification

Any modifications installed previous to testing by GRE will be incorporated in each production model sold/leased in the United States.

Intertek Testing Services installed no modifications.

3.0 Emission Test Results

AC line conducted emission measurements were performed from 0.15 MHz to 30 MHz. Analyzer resolution is 10 kHz or greater.

Radiated emission measurements and antenna conducted emission measurements were performed from 30 MHz to 2000 MHz. Analyzer resolution is 100 kHz or greater for frequencies from 30 MHz to 1000 MHz, 1 MHz - for frequencies above 1000 MHz.

Data is included of the worst-case configuration (the configuration which resulted in the highest emission levels). A sample calculation, configuration photographs and data tables of the emissions are included. All measurements were performed with peak detection unless otherwise specified.

3.1 Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG + DF$$

Where FS = Field Strength in dB(μ V/m)

RA = Receiver Amplitude (including preamplifier) in dB(μ V)

CF = Cable Attenuation Factor in dB

AF = Antenna Factor in dB(1/m)

AG = Amplifier Gain in dB

DF = Distance Factor in dB

Assume a receiver reading of 52.0 dB(μ V) is obtained. The antennas factor of 7.4 dB(1/m) and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving field strength of 32 dB(μ V/m). This value in dB(μ V/m) was converted to its corresponding level in μ V/m.

$$RA = 52.0 \text{ dB}(\mu\text{V})$$

$$AF = 7.4 \text{ dB}(1/\text{m})$$

$$CF = 1.6 \text{ dB}$$

$$AG = 29.0 \text{ dB}$$

$$DF = 0 \text{ dB}$$

$$FS = 52 + 7.4 + 1.6 - 29.0 + 0 = 32 \text{ dB}(\mu\text{V}/\text{m})$$

$$\text{Level in } \mu\text{V}/\text{m} = \text{Common Antilogarithm } [(32 \text{ dB}\mu\text{V}/\text{m})/20] = 39.8 \mu\text{V}/\text{m}$$

Tested By:	Arkadi Kaplan
Test Date:	May 19, 2003

Temperature (°C)	21.5 ⁰ C
Relative Humidity (%)	45.0%

The results on the following page(s) were obtained when the device was tested in the condition described in Sections 2 and 3.

Results:	Complies by 12.2 dB at 1240 MHz (Tuned frequency 859.2 MHz)
-----------------	---

All other emissions are at least 10 dB below the limit.

4. FEATURES

- 4.1 The scanner can receiving Phase 1 APCO-25 C4FM/IMBE digital voice modulation
- 4.2 10 bank and 500 channel memories for trunking bank and channel combined with conventional mode
- 4.3 Scan both trunking and conventional channels at same time
- 4.4 V-Scanner Folders – Eleven 500 channel virtual scanner folders, total 5, 500 channels
- 4.5 1,500 ID memories in 10 ID banks, 5 sub-ID memories in each bank and each sub-ID memory has 30 ID locations. (V-Scanner Folders, Total 16,500 ID memories)
- 4.6 The scanner can receive Motorola APCO-25 digital trunking system of 3,600 and 9,600 BPS CC.
- 4.7 The scanner can receive Motorola VHF and UHF (Type I/II) trunking system.
- 4.8 The scanner can receive VHF and UHF EDACS trunking system.
- 4.9 The scanner can receive CTCSS and DCS data.
- 4.10 Alphanumeric data entry and display
- 4.11 Clone the memory to other unit (Use 20-289 PC cable)
- 4.12 Pre-programmed Marine, CB, FRS/GMRS/MURS, Fire/Police, Aircraft, Ham and Weather frequencies
- 4.13 WX alert (1050 Hz tone) and SAME (Specific Area Message Encoding) system receive
- 4.14 Attenuator control (Normal attenuator and Global attenuator)
- 4.15 Built-in power save circuit
- 4.16 Frequency tune mode (Frequency ▲ or ▼)
- 4.17 "Zeromatic" tuning system
