1. Dipole Construction & Electrical Characteristics

The validation dipole was constructed in accordance with the IEEE Std “Recommended Practice for Determining the Spatial-Peak Specific Absorption Rate (SAR) in the Human Body Due to Wireless Communications Devices: Experimental Techniques”. The electrical properties were measured using an HP 8753E Network Analyzer. The network analyzer was calibrated to the validation dipole N-type connector feed point using an HP85032E Type N calibration kit. The dipole was placed parallel to a planar phantom at a separation distance of 15.0mm from the simulating fluid using a loss-less dielectric spacer. The measured input impedance is:

Feed point impedance at 450MHz

$$\text{Re}\{Z\} = 49.982\Omega$$

$$\text{Im}\{Z\} = 5.8594\Omega$$

Return Loss at 450MHz

$$-24.714\text{dB}$$

2450	51.8	30.6	3.6
3000	41.5	25.0	3.6

2. Validation Phantom

The validation phantom was constructed using relatively low-loss tangent Plexiglas material. The dimensions of the phantom are as follows:

Length: 83.5 cm
Width: 36.9 cm
Height: 21.8 cm

The bottom of the phantom is constructed of 6.2 ± 0.1 mm Plexiglas.

3. Measurement Conditions

The planar phantom was filled with brain simulating tissue having the following electrical parameters at 450MHz:

Relative Permittivity:	43.8	$\pm 5\%$
Conductivity:	0.86 mho/m	$\pm 5\%$
Temperature:	23.1°C	

The 450MHz simulating tissue consists of the following ingredients:

Ingredient	Percentage by weight
Water	38.56%
Sugar	56.32%
Salt	3.95%
HEC	0.98%
Dowicil 75	0.19%
Target Dielectric Parameters at 22°C	$\epsilon_r = 43.5$ $\sigma = 0.87 \text{ S/m}$

4. SAR Measurement

The SAR measurement was performed with the E-field probe in mechanical detection mode only. The setup and determination of the forward power into the dipole was performed using the following procedures.

First the power meter **PM1** (including attenuator **Att1**) is connected to the cable to measure the forward power at the location of the dipole connector (**X**). The signal generator is adjusted for the desired forward power at the dipole connector (taking into account the attenuation of **Att1**) as read by power meter **PM2**. After connecting the cable to the dipole, the signal generator is readjusted for the same reading at power meter **PM2**. If the signal generator does not allow adjustment in 0.01dB steps, the remaining difference at **PM2** must be taken into consideration. **PM3** records the reflected power from the dipole to ensure that the value is not changed from the previous value. The reflected power should be 20dB below the forward power.

Ten SAR measurements were performed in order to achieve repeatability and to establish an average target value.
