SECTION 4: Operation of E.U.T. during testing

4.1 Operating Modes

The mode used for test :

1. Transmitting mode: GFSK (Packet size DH1^{*1)}, DH3^{*1)}, DH5, Data packet: PRBS9)
 - Low Channel : 2402MHz
 - Mid Channel : 2441MHz
 - High Channel : 2480MHz
2. Transmitting mode: 8DPSK^{*2)} (Packet size 3-DH1^{*1)}, 3-DH3^{*1)}, 3-DH5, Data packet: PRBS9)
 - Low Channel : 2402MHz
 - Mid Channel : 2441MHz
 - High Channel : 2480MHz
3. Transmitting mode: $\pi/4$ DQPSK (Packet size: 2-DH5, Data packet: PRBS9)
 - Low Channel : 2402MHz
 - Mid Channel : 2441MHz
 - High Channel : 2480MHz
4. Receiving mode
 - Mid Channel : 2441MHz
5. Inquiry mode
6. Hopping ON mode: GFSK
7. Hopping ON mode: EDR

*¹⁾ Used for Dwell time test only

*²⁾ As the Conducted Power level at 8DPSK was higher than the one at $\pi/4$ DQPSK , the test was performed at 8DPSK.

*³⁾ 3, 5, 6, 7: only for Antenna Terminal Conducted test

Remarks: Test was not performed at AFH mode, because the decrease of number of channel (min: 20ch) at AFH mode does not influence on the output power, bandwidth, and spurious emission of the EUT. However, the limit level 125mW mode was used due to AFH and EDR mode.

SECTION 5: Conducted Emission

Test Procedure and conditions

EUT was placed on a urethane platform of nominal size, 1.0m by 1.5m, raised 80cm above the conducting ground plane.

The rear of tabletop was located 40cm to the vertical conducting plane. The rear of EUT, including peripherals aligned and flushed with rear of tabletop. All other surfaces of tabletop were at least 80cm from any other grounded conducting surface. EUT was located 80cm from a Line Impedance Stabilization Network (LISN)/ Artificial mains Network (AMN) and excess AC cable was bundled in center.

For the tests on EUT with other peripherals (as a whole system)

I/O cable and AC cables that were connected to the peripherals were bundled in center. They were folded back and forth forming a bundle 30cm to 40cm long and were hanged at a 40cm height to the ground plane.

The AC Mains Terminal Continuous disturbance Voltage has been measured with the antenna in a Semi Anechoic Chamber or a Measurement Room.

The EUT was connected to a LISN (AMN).

An overview sweep with peak detection has been performed.

[Radiated]

Test Procedure

EUT was placed on a urethane platform of nominal size, 1.0m by 1.5m, raised 80cm above the conducting ground plane.

The Radiated Electric Field Strength intensity has been measured in a Semi Anechoic Chamber with a ground plane and at a distance of 3m(Below 10GHz) and 1m(Upper 10GHz).

The height of the measuring varied between 1 and 4m and EUT was rotated a full revolution in order to obtain the maximum value of the electric field intensity.

The measurements were performed for both vertical and horizontal antenna polarization with the Test Receiver, or the Spectrum Analyzer (in linear mode).

The test was made with the detector (RBW/VBW) in the following table.

When using Spectrum analyzer, the test was made with adjusting span to zero by using peak hold.

In any 100kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator confirmed 20dB below that in the 100kHz bandwidth within the band that contains the highest level of the desired power, based on a radiated measurement.

20dBc was applied to the frequencies * over the limit of FCC 15.209 / Table 2 of RSS-210 2.7 (IC) and outside the restricted band of 15.205 / Table 1 of RSS-210 2.7 (IC).

(*frequencies at which the margin is below the site uncertainty described in Section 3.4)

Frequency	Below 1GHz	Above 1GHz
Instrument used	Test Receiver / Spectrum Analyzer	Spectrum Analyzer
Detector	QP: BW 120kHz(T/R)	PK: RBW:1MHz/VBW: 1MHz
IF Bandwidth	20dBc : RBW: 100kHz VBW: 300kHz (S/A)	AV: RBW:1MHz/VBW:10Hz 20dBc : RBW:100kHz/VBW:300kHz

The carrier level and noise levels were confirmed at each position of X and Y axes of EUT to see the position of maximum noise, and the test was made at the position that has the maximum noise.

Dwell time factor

(FCC Public Notice DA 00-705 : Released March 30, 2000

Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems)

As the carrier frequency may occupy each channel twice for a period of 100ms when AFH functions and the number of Hopping channel is reduced to minimum 20, the following equation was used.

- Duty cycle correction factor = $20\log [\text{Dwell time(ms)}^2 / 100(\text{ms})]$
